### **NEW QUESTION # 54**

Northern Trail Outfitters publishes REST APIs to Anypoint Exchange. They write the REST APIs using RAML and share these

APIs with internal and external users.

In which language or languages can a user download these APIs?

- A. RAML, OAS, and Apiary
- B. RAML only
- **C. RAML and OAS only**
- D. RAML and Apiary only

**Answer: C**

Explanation:

Users can download REST APIs published to Anypoint Exchange in the following languages:

RAML (RESTful API Modeling Language):

RAML is a modeling language for defining APIs, used by MuleSoft for creating REST APIs.

OAS (OpenAPI Specification):

OAS, also known as Swagger, is another widely-used standard for defining APIs.

MuleSoft supports both RAML and OAS formats, allowing users to choose between these two standards when downloading API definitions.

#### **NEW QUESTION # 55**

An RPA process is invoked by a MuleSoft Composer flow. The RPA process has a User Task that can take up to 24 hours to complete.

- A. Create a second MuleSoft Composer flow that runs on a schedule and checks if the RPA process is complete.
- **B. Create a second MuleSoft Composer flow that starts when the RPA process is complete.**
- C. Wait for the RPA process to complete and invoke a second MuleSoft Composer flow via REST API.
- D. Wait for the RPA process to complete and use the results in the same MuleSoft Composer flow.
- E. Using best practices, how should the results be consumed by MuleSoft Composer?

**Answer: B**

Explanation:

When an RPA process involves a User Task that can take a significant amount of time (up to 24 hours) to complete, it is best to use a follow-up mechanism to handle the results once the process is finished:

Second MuleSoft Composer Flow:

Create a second MuleSoft Composer flow that is triggered when the RPA process completes. This ensures that the first flow is not held up while waiting for the long-running RPA process to finish.

The second flow can start based on an event, such as the completion status of the RPA process, ensuring timely and efficient processing of the results.

Trigger Mechanism:

Configure the RPA process to notify MuleSoft Composer when it is complete, possibly using a REST API or another integration method.

Best Practices:

This approach adheres to best practices by keeping flows modular and focused on specific tasks, making them easier to manage and troubleshoot.

#### **NEW QUESTION # 56**

AnyAirlines is developing an RPA process and is implementing testing best practices. They want to take the RPA process through rigorous testing.

During these tests, where do RPA process test plans execute?

- **A. On a configured RPA Bot**
- B. In an RPA process runtime

- C. In RPA Builder
- D. In RPA Manager

**Answer: A**

Explanation:

During testing of an RPA process, test plans are executed on a configured RPA Bot. This allows you to simulate real-world scenarios and ensure the RPA process works correctly under various conditions:

On a Configured RPA Bot:

RPA Bots are configured to execute the automated tasks defined in the RPA process. By running test plans on these bots, you can verify the functionality and performance of the RPA process.

This approach ensures that the RPA process is thoroughly tested in an environment that closely mirrors production conditions.

### NEW QUESTION # 57

A MuleSoft developer at AnyAirlines is tasked with creating a new API for an integration. According to best practices, what is the first step they need to perform?

- A. Install a standalone Mule runtime on their local machine.
- **B. Create a RAML definition in Design Center.**
- C. Create a case in Salesforce.
- D. Create a new project in Anypoint Studio.

**Answer: B**

Explanation:

RAML Definition Creation: The first step in creating a new API as per MuleSoft best practices is to create a RAML (RESTful API Modeling Language) definition in the Design Center. This step is critical as it outlines the API's structure, endpoints, methods, and data types, providing a clear blueprint for subsequent development.

Reference: MuleSoft API Design Best Practices

Project Creation in Anypoint Studio: Once the RAML definition is created, the next step would be to generate the API project in Anypoint Studio. This IDE allows developers to implement the API logic as defined in the RAML.

Reference: Getting Started with Anypoint Studio

Mule Runtime Installation: Installing Mule runtime is necessary for running and testing Mule applications locally. However, this step is secondary to defining the API's structure.

Reference: Mule Runtime Installation

Case Creation in Salesforce: Creating a case in Salesforce is not relevant to the API development process but may be necessary for support or project management purposes.

### NEW QUESTION # 58

AnyAirlines implements a credit card program that requires customer applications to go through a review process before approval. They want to develop a series of hyperautomation solutions that will integrate to process the applications and enter the customer's information into a legacy system once approved.

They want to complete the following components:

An Einstein bot that will initiate the credit card application and create a record of an existing Salesforce Custom Object  
 A Salesforce flow that marks the credit card application as approved in Salesforce  
 An RPA process that interacts with multiple applications and websites  
 A simple MuleSoft Composer flow that triggers if a credit card application is approved and then invokes an RPA process  
 Which component will likely require the most effort to complete?

- **A. An RPA process that interacts with multiple applications and websites**
- B. An Einstein bot that will initiate the credit card application and create a record of an existing Salesforce Custom Object
- C. A Salesforce flow that marks the credit card application as approved in Salesforce
- D. A simple MuleSoft Composer flow that triggers if a credit card application is approved and then invokes an RPA process

**Answer: A**

Explanation:

Developing an RPA process that interacts with multiple applications and websites typically requires the most effort due to several factors:

**Complexity of Interaction:**

RPA processes involve simulating human actions to interact with different user interfaces. This includes navigating web pages, filling out forms, and clicking buttons, which can be complex and time-consuming to script and test.

**Integration Challenges:**

The RPA process must handle different applications and websites, each with unique behaviors and potential for errors. Ensuring reliable and consistent interaction across these systems requires thorough testing and potentially custom handling for each system.

**Maintenance and Updates:**

RPA processes need to be maintained and updated as the applications or websites they interact with change.

This ongoing effort can be significant compared to other components.
