

Exam CWAP-405 Overviews | Exam CWAP-405 Objectives Pdf

2026 Latest Itcertmaster CWAP-405 PDF Dumps and CWAP-405 Exam Engine Free Share: <https://drive.google.com/open?id=1DPLa4Cbvanjth5k0pnXjG0eifLCFnFE>

Now are you in preparation for CWAP-405 exam? If so, you must be a man with targets. Our Itcertmaster are committed to help such a man with targets to achieve the goal. CWAP-405 exam simulation software developed by us are filled with the latest and comprehensive questions. If you buy our product, we will offer one year free update of the questions for you. With our software, passing CWAP-405 Exam will no longer be the problem.

The CWAP-405 Certification Exam is one of the top-rated and career-oriented certificates that are designed to validate an CWNP professional's skills and knowledge level. These Certified Wireless Analysis Professional (CWAP-405) practice questions have been inspiring those who want to prove their expertise with the industrial-recognized credential. By cracking it you can gain several personal and professional benefits.

Exam CWAP-405 Objectives Pdf & Reliable CWAP-405 Exam Cost

One failure makes many candidates fall into despair, become unconfident or even someone want to give up testing for IT certification. Now CWAP-405 reliable practice exam online will help you out. It covers most real test questions and will assist you to clear exam certainly. You will be confident in your test. CWAP-405 reliable practice exam online will be an important choice for your CWNP certification. Sometimes choice is greater than effort.

CWNP Certified Wireless Analysis Professional Sample Questions (Q38-Q43):

NEW QUESTION # 38

Why would a STA that supports 802.11k Radio Measurement send a Neighbor Request to an AP?

- A. To learn about neighboring interference sources and tune its RF radio accordingly
- B. To request a list of neighboring STAs which enables the STA to better pick the right protection mechanisms
- **C. To request a list of neighboring APs which the STA can use as roaming candidates**
- D. To inform the current AP about the STA's intent to roam to a neighboring AP, ensuring a seamless handover

Answer: C

Explanation:

A STA that supports 802.11k Radio Measurement would send a Neighbor Request to an AP to request a list of neighboring APs which the STA can use as roaming candidates. A Neighbor Request is an Action frame that contains a subelement specifying the type of information that the STA wants to receive from the AP. A Neighbor Report is an Action frame that contains a subelement with a list of neighboring APs that match the criteria specified in the Neighbor Request. The Neighbor Report provides information such as BSSID, channel, operating class, and PHY type of each neighboring AP. This information helps the STA to perform intelligent roaming decisions based on signal quality, load, and compatibility. NEW QUESTION # 39

Protocol analyzers may present field values in either binary, decimal or hexadecimal. What precedes a hexadecimal value to indicate it is hexadecimal?

- A. HEX
- B. 16x
- **C. 0x**
- D. %

Answer: C

Explanation:

A hexadecimal value is a value that uses base 16 notation, which means it can have digits from 0 to 9 and letters from A to F. A hexadecimal value is usually preceded by 0x to indicate that it is hexadecimal and not decimal or binary.

For example, 0x0A is hexadecimal for 10 in decimal or 00001010 in binary. The other options are not valid prefixes for hexadecimal values.

NEW QUESTION # 40

You are troubleshooting a client that is experiencing slow WLAN performance. As part of the troubleshooting activity, you start a packet capture on your laptop close to the client device. While analyzing the packets, you suspect that you have not captured all packets transmitted by the client. By analyzing the trace file, how can you confirm if you have missing packets?

- **A. Look for gaps in the sequence number in MAC headers.**
- B. Retransmission are an indication of missing packets
- C. Protocol Analyzers show the number of missing packets in their statistics view
- D. The missing packets will be shown as CRC errored packets

Answer: A

Explanation:

One way to confirm if you have missing packets in your packet capture is to look for gaps in the sequence number in MAC headers. The sequence number is a 12-bit field in the MAC header that is used to identify and order data frames within a traffic stream. The sequence number is incremented by one for each new data frame transmitted by a STA, except for retransmissions, fragments, and control frames. The sequence number can range from 0 to 4095, and then wraps around to 0. If you see a jump or a gap in the sequence number between two consecutive data frames from the same STA, it means that you have missed some packets in

between. The other options are not correct, as they do not confirm if you have missing packets in your packet capture. CRC errored packets are packets that have been corrupted during transmission and have failed the error detection check. Protocol analyzers may show the number of CRC errored packets in their statistics view, but not the number of missing packets. Retransmissions are an indication of packet loss or collision, but not necessarily of missing packets in your capture. NEW QUESTION # 41

ABC Company requires the ability to identify and quickly locate rogue devices. ABC has chosen an overlay WIPS solution with Wi-Fi sensors that use dipole antennas to perform this task. No other sensors are included. Use your knowledge of location tracking techniques to answer the question.

Which one of the following location methods is not available in the described system?

- A. Trilateration of RSSI measurements
- **B. RF Fingerprinting**
- C. GPS Positioning
- D. Time Difference of Arrival (TDoA)

Answer: B

NEW QUESTION # 42

Which one of the following is an advantage of using display filters that is not an advantage of capture-time filters?

- A. Once created they are reusable for later captures
- B. Multiple of them can be applied simultaneously
- C. They allow for focused analysis on just the packets of interest
- **D. They only hide the packets from view and the filtered packets can be enabled for view later**

Answer: D

Explanation:

Display filters are applied after the capture is completed and they only hide the packets from view. The filtered packets are still present in the capture file and can be enabled for view later by changing or removing the display filter. This is an advantage over capture-time filters, which discard the packets that do not match the filter criteria and cannot be recovered later.
