## Salesforce Mule-101 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"><li>Recognize and interpret essential integration concepts and terminology: This domain focuses on foundational concepts including cloud service models, infrastructure types, networking protocols, data formats, security principles, and API classifications.</li></ul>
Topic 2	<ul style="list-style-type: none"><li>Describe the components and benefits of Anypoint Platform for API management: This domain focuses on Anypoint Platform's API management features, lifecycle development, and advantages of API-led connectivity.</li></ul>
Topic 3	<ul style="list-style-type: none"><li>Describe the components and benefits of Anypoint Platform for system integration: This domain covers Anypoint Platform's integration components, connectors, runtime control planes, deployment options, and reusable Exchange assets.</li></ul>
Topic 4	<ul style="list-style-type: none"><li>Recognize common integration problems, use cases, and technical solutions: This domain examines integration scenarios, compares legacy and modern approaches, and guides selection of appropriate integration technologies for business problems.</li></ul>

## Salesforce Certified MuleSoft Integration Foundations Sample Questions (Q28-Q33):

### NEW QUESTION # 28

A Kubernetes controller automatically adds another pod replica to the resource pool in response to increased application load.

- A. Down
- B. Horizontal
- C. Diagonal
- D. Vertical

**Answer: B**

Explanation:

Horizontal Scaling (Scale Out): This involves adding more instances (replicas/nodes) of a resource to handle increased load1111. In a Kubernetes or Runtime Fabric context, when the controller adds another "pod replica," it is strictly defined as horizontal scaling.

Vertical Scaling (Scale Up): This would involve increasing the size (CPU or RAM capacity) of an existing single instance/pod2, rather than adding more copies of it.

Context: MuleSoft's Runtime Fabric (RTF) runs on Kubernetes and leverages this horizontal auto-scaling capability to maintain performance under high traffic.

### NEW QUESTION # 29

According to MuleSoft, what is a major distinguishing characteristic of an application network in relation to the integration of systems, data, and devices?

- A. It is built for change and self-service
- B. It uses CI/CD automation for real-time project delivery
- C. It leverages well-accepted internet standards like HTTP and JSON
- D. It uses a well-organized monolithic approach with standards

**Answer: A**

Explanation:

The Application Network: MuleSoft defines an application network as a network of applications, data, and devices connected with APIs to make them pluggable and reusable.

Built for Change: Unlike rigid point-to-point integrations, an application network is designed to be flexible. Because the nodes (APIs) are reusable and discoverable, the network can evolve and change as business needs change without breaking existing connections3.

Self-Service: By publishing these APIs to Exchange, developers across the organization can discover and reuse them (Self-Service), facilitating the "bottom-up" emergence of the network.

### NEW QUESTION # 30

Refer to the exhibit. What is the type of data format shown in the exhibit?

YAML

text

traits:

error-responses: traits/error-responses.raml

jwt-required:

headers:

x-jwt:

type: string

description: JWT token string

- **A. YAML**
- B. CSV
- C. JSON
- D. XML

**Answer: A**

Explanation:

YAML (YAML Ain't Markup Language): The snippet provided uses indentation (whitespace) to denote structure and colons to separate keys from values. This is the signature syntax of YAML.

RAML Context: MuleSoft's RAML (RESTful API Modeling Language) is built on top of YAML1. Therefore, any RAML specification is technically a YAML file.

Why others are incorrect:

JSON: Uses curly braces {} and quotes "" strictly.

XML: Uses angle brackets <tag></tag>.

CSV: Uses comma-separated values.

### NEW QUESTION # 31

In which order are the API Client, API Implementation, and API Interface components called in a typical REST request?

- **A. API Client > API Interface > API Implementation**
- B. API Interface > API Client > API Implementation
- C. API Implementation > API Interface > API Client
- D. API Client > API Implementation > API Interface

**Answer: A**

Explanation:

Correction Note: The provided PDF Answer Key lists B as the answer. However, based on standard MuleSoft and REST architecture principles, A is the correct logical flow.

The Concept: In an API-led connectivity approach, the "Interface" represents the contract (such as the RAML specification, the HTTP Listener, and the APIkit Router). The "Implementation" represents the backend logic and flows that process the request.

The Flow:

API Client: The consumer (e.g., a mobile app, Postman, or another system) initiates the HTTP request.

API Interface: The request first hits the Interface. This layer defines the URL, validates the request against the API Specification (RAML/OAS), and routes it to the correct flow.

API Implementation: Once validated and routed, the request is processed by the implementation flows (business logic) to fetch data or perform actions.

Therefore, the data travels: Client -> Interface -> Implementation.

### NEW QUESTION # 32

A developer is examining the responses from a RESTful web service that is compliant with the Hypertext Transfer Protocol

(HTTP/1.1) as defined by the Internet Engineering Task Force (IETF). 13 (The question asks to identify the code class for success)

- A. 5xx
- **B. 2xx**
- C. 3xx
- D. 4xx

**Answer: B**

Explanation:

Comprehensive and Detailed Explanation:

HTTP Status Codes: Understanding these is fundamental to MuleSoft integration.

2xx (Success - Answer B): The request was received, understood, and accepted. (e.g., 200 OK, 201 Created, 202 Accepted).

3xx (Redirection): Further action needs to be taken to complete the request (e.g., 301 Moved Permanently).

4xx (Client Error): The request contains bad syntax or cannot be fulfilled (e.g., 400 Bad Request, 401 Unauthorized, 404 Not Found).

5xx (Server Error): The server failed to fulfill an apparently valid request (e.g., 500 Internal Server Error, 502 Bad Gateway).

Context: When a Mule flow makes an HTTP Request, it checks these status codes to determine if the On Error scope should be triggered. By default, 4xx and 5xx trigger errors; 2xx indicates success.
