SISA Certified Security Professional in Artificial Intelligence Sample Questions (Q34-Q39):

NEW QUESTION # 34

During the development of AI technologies, how did the shift from rule-based systems to machine learning models impact the efficiency of automated tasks?

- A. Increased system complexity and the requirement for specialized knowledge,
- B. Improved scalability and performance in handling diverse and evolving data.
- C. Enabled more dynamic decision-making and adaptability with minimal manual intervention
- D. Enhanced the precision and relevance of automated outputs with reduced manual tuning.

Answer: C

Explanation:

The transition from rigid rule-based systems, which rely on predefined logic and struggle with variability, to machine learning models introduced data-driven learning, allowing systems to adapt dynamically to new patterns with less human oversight. This shift boosted efficiency in automated tasks by enabling real-time adjustments, such as in spam detection where ML models evolve with threats, unlike static rules. It minimized manual rule updates, fostering scalability and handling complex, unstructured data effectively. However, it introduced challenges like interpretability needs. In GenAI evolution, this paved the way for advanced models like Transformers, impacting sectors by automating nuanced decisions. Exact extract: "The shift enabled more dynamic decision-making and adaptability with minimal manual intervention, significantly improving the efficiency of automated tasks." (Reference: Cyber Security for AI by SISA Study Guide, Section on AI Evolution and Impacts, Page 20-23).

NEW QUESTION # 35

Which of the following is a primary goal of enforcing Responsible AI standards and regulations in the development and deployment of LLMs?

- A. Ensuring that AI systems operate safely, ethically, and without causing harm
- B. Focusing solely on improving the speed and scalability of AI systems
- C. Developing AI systems with the highest accuracy regardless of data privacy concerns
- D. Maximizing model performance while minimizing computational costs.

Answer: A

Explanation:

Responsible AI standards, including ISO 42001 for AI management systems, aim to promote ethical development, ensuring safety, fairness, and harm prevention in LLM deployments. This encompasses bias mitigation, transparency, and accountability, aligning with societal values. Regulations like the EU AI Act reinforce this by categorizing risks and mandating safeguards. The goal transcends performance to foster trust and sustainability, addressing issues like discrimination or misuse. Exact extract: "The primary goal is to ensure AI systems operate safely, ethically, and without causing harm, as outlined in standards like ISO 42001." (Reference: Cyber Security for AI by SISA Study Guide, Section on Responsible AI and ISO Standards, Page 150-153).

NEW QUESTION # 36

Which of the following describes the scenario where an LLM is embedded 'As-is' into an application frame?

- A. Integrating the LLM into the application without modifications, using its out-of-the-box capabilities directly within the application.
- B. Replacing the LLM with a more specialized model tailored to the application's needs.
- C. Customizing the LLM to fit specific application requirements and workflows before integration.
- D. Using the LLM solely for backend data processing, while the application handles all user interactions.

Answer: A

Explanation:

Embedding an LLM 'as-is' means direct integration of the pretrained model into the app framework without alterations, relying on its inherent capabilities for tasks like text generation, simplifying SDLC by avoiding customization overhead. This is suitable for general-purpose apps but may lack optimization for specifics, contrasting with tailored approaches. It accelerates deployment while posing risks like unmitigated biases, necessitating post-integration safeguards. Exact extract: "It describes integrating the LLM without modifications, using out-of-the-box capabilities directly in the application." (Reference: Cyber Security for AI by SISA Study Guide, Section on LLM Integration Methods, Page 110-113).

NEW QUESTION # 37

What is the main objective of ISO 42001 in AI management systems?

- A. To establish requirements for an AI management system within organizations.
- B. To regulate hardware used in AI deployments.
- C. To provide guidelines only for small-scale AI projects.
- D. To focus solely on technical specifications for AI algorithms.

Answer: A

Explanation:

ISO 42001 outlines a framework for organizations to manage AI responsibly, covering risk assessment, governance, and continual improvement. It ensures alignment with ethical principles, promoting trustworthy AI through structured processes. Applicable across sectors, it integrates with existing management systems like ISO 27001. Exact extract: "The main objective of ISO 42001 is to establish requirements for an AI management system in organizations." (Reference: Cyber Security for AI by SISA Study Guide, Section on ISO 42001 Overview, Page 260-263).

NEW QUESTION # 38

What does the OCTAVE model emphasize in GenAI risk assessment?

- A. Operational Critical Threat, Asset, and Vulnerability Evaluation focused on organizational risks.
- B. Short-term tactical responses over strategic planning.
- C. Solely technical vulnerabilities in AI models.
- D. Exclusion of stakeholder input in assessments.

Answer: A

Explanation:

OCTAVE adapts to GenAI by emphasizing organizational risk perspectives, identifying critical assets like models and data, evaluating threats, and prioritizing mitigations through stakeholder collaboration. It fosters a strategic, enterprise-wide approach to AI risks, integrating business impacts. Exact extract: "OCTAVE emphasizes operational critical threat, asset, and vulnerability evaluation in GenAI risk assessment." (Reference: Cyber Security for AI by SISA Study Guide, Section on OCTAVE for AI, Page 255-258).
