## VMware 2V0-16.25 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"><li>• Troubleshoot and Optimize the VMware Solution: This section of the exam measures the ability of Systems Engineers to troubleshoot and optimize VMware-based environments. While no explicit testable objectives are listed, candidates are expected to apply their problem-solving skills to diagnose, resolve, and enhance VMware solutions for improved reliability and performance.</li></ul>
Topic 2	<ul style="list-style-type: none"><li>• IT Architectures, Technologies, Standards: This section of the exam measures the understanding of IT Infrastructure Architects and covers foundational concepts of architectures, emerging technologies, and industry standards. Although no testable objectives are listed here, it establishes the baseline knowledge needed to interpret and design VMware-related environments effectively.</li></ul>
Topic 3	<ul style="list-style-type: none"><li>• Plan and Design the VMware by Broadcom Solution: This section of the exam measures the ability of VMware Solution Architects to plan and design solutions. While there are no specific testable objectives included, the focus is on preparing professionals to design VMware-based solutions that align with organizational goals and best practices.</li></ul>
Topic 4	<ul style="list-style-type: none"><li>• VMware vSphere Foundation Fundamentals: This section of the exam measures the skills of Virtualization Engineers and focuses on the essentials of virtualization technology. It introduces the principles of virtualization, explores use cases, and highlights the value it brings to businesses. Candidates are expected to demonstrate knowledge of VMware compute components such as vCenter and ESX, cluster configuration, and lifecycle management of virtual machines. It also covers secure workload operations, encryption, and managing resources with content libraries. In addition, storage fundamentals are examined through configuring vSphere storage, deploying VMware vSAN clusters, defining storage policies, and ensuring data availability. Networking fundamentals are also introduced, requiring the ability to differentiate between VMware vSphere networking components.</li></ul>
Topic 5	<ul style="list-style-type: none"><li>• Deploy, Configure, and Operate VMware vSphere Foundation (VVF): This section of the exam measures the expertise of Data Center Administrators and emphasizes hands-on skills in deploying and configuring VMware vSphere Foundation environments. Candidates must understand the components of a VVF deployment, configure Supervisors within clusters, and manage identity, access control, licensing and certificate management. The objectives also extend to lifecycle management within the vSphere Foundation. Furthermore, it explores operational tasks including monitoring and analyzing logs, configuring alerting, managing dashboards, and integrating with VMware Cloud Foundation (VCF) Operations. Candidates will also be tested on cost and pricing configuration, compliance monitoring, and security hardening practices. Finally, automation skills are validated through deploying services with Supervisors, running Kubernetes workloads, using VM services, and integrating VCF Operations Orchestrator to support enterprise automation.</li></ul>

## VMware vSphere Foundation 9.0 Administrator Sample Questions (Q50-Q55):

### NEW QUESTION # 50

An administrator is preparing to deploy VMware vSphere Foundation using the VMware Cloud Foundation (VCF) Installer wizard. During host onboarding, it is discovered that the VMware ESX hosts each have different root passwords. Which deployment method must be used to continue the installation?

- A. Proceed with the wizard and override host credentials during staging.
- **B. Use a JSON specification file to define per-host credentials.**
- C. Use the deployment wizard and enter credentials per host manually.
- D. Set the password to expire on all ESX hosts.

**Answer: B**

Explanation:

When deploying VMware vSphere Foundation using the VCF Installer wizard, host onboarding requires consistent access credentials.

- \* If ESX hosts have different root passwords, the wizard cannot proceed using a single credential.
- \* In this case, administrators must use a JSON specification file to define per-host credentials, ensuring each host can be onboarded successfully.
- \* The JSON specification allows defining host-specific parameters (IP, hostname, root password, networking, etc.).

Other options are incorrect:

- \* A. Proceed with wizard and override host credentials during staging# Not supported.
- \* B. Use deployment wizard and enter credentials per host manually# Wizard requires uniform credentials.
- \* C. Set password to expire on all ESX hosts# Irrelevant to deployment and would cause failures.

### NEW QUESTION # 51

During a recent audit, it was determined that a group of users may have been compromised. These users should not have access to any VMware vCenter resources while an investigation is underway. All the affected users have been placed into a SUSPECT\_USERS group.

Which step is required to ensure that the suspect users will never have access to resources in vCenter?

- A. Disconnect the vCenter from Active Directory.
- B. Assign the SUSPECT\_USERS group the Read-only role to the vCenter Object and check propagate.
- C. Assign the SUSPECT\_USERS group the No access role to the vCenter Object and check propagate.
- D. Assign the SUSPECT\_USERS group the Administrator role to the vCenter Object and uncheck propagate.

**Answer: C**

Explanation:

To ensure compromised users cannot access vCenter resources:

- \* Assign the No Access role at the vCenter level.
- \* Enable propagation so this restriction applies to all child objects.
- \* This guarantees zero permissions for SUSPECT\_USERS.

Other options:

- \* B. Administrator with uncheck propagate# Still gives dangerous access at root level.
- \* C. Disconnect Active Directory# Disrupts all AD users, not just suspect ones.
- \* D. Read-only role# Still grants access, not acceptable during investigation.

### NEW QUESTION # 52

Which rule in a virtual machine (VM) storage policy is configured to ensure data redundancy in a VMware vSAN environment?

- A. Flash Read Cache Reservation
- B. Failures to Tolerate
- C. Stripe Width
- D. Disk Stripes Per Object

**Answer: B**

Explanation:

The VM Storage Policy rule that controls data redundancy in vSAN is Failures to Tolerate (FTT).

- \* Defines the number of hardware failures (host, disk, network) that vSAN can tolerate while maintaining data availability.
- \* Configurations include RAID-1 (mirroring), RAID-5/6 (erasure coding).

Other options:

- \* B. Disk Stripes Per Object# Defines performance striping, not redundancy.
- \* C. Stripe Width# Same as above, not redundancy.
- \* D. Flash Read Cache Reservation# Relates to caching performance, not redundancy.

### NEW QUESTION # 53

An administrator needs to ensure that only specific users can manage the virtual machines (VM) in a specific VMware vCenter folder.

Which three steps are required to accomplish this? (Choose three.)

- A. Add the identity source to vCenter.
- B. Create a datastore cluster.
- C. Assign the new role to the appropriate users/groups.
- D. Apply the role to the specific vCenter folder.
- E. Create a new role in vCenter with VM management permissions.

**Answer: C,D,E**

Explanation:

To ensure that only specific users can manage VMs in a specific VMware vCenter folder, the following three steps are required:

\* Create a new role in vCenter with VM management permissions(Answer B):You must define a custom role tailored to managing VMs, which includes permissions such as powering on/off VMs, editing VM settings, and accessing consoles. This role must include the appropriate privileges under the

"Virtual machine" category in vCenter permissions.

\* Apply the role to the specific vCenter folder(Answer C):The custom role needs to be applied directly to the target vCenter folder. This enables scope-based access control, where permissions are applied only to VMs within that folder.

\* Assign the new role to the appropriate users/groups(Answer A):After creating the role and applying it to the folder, the role must be associated with the correct users or groups. This step uses the vCenter Server's identity source integration to assign roles.

Why the other options are incorrect:

\* D. Add the identity source to vCenter:This is a prerequisite step for any role assignment but is not directly required in this specific scenario if the identity source is already configured.

\* E. Create a datastore cluster:This is unrelated to managing VM access. Datastore clusters pertain to storage management and are not involved in user permissions or role assignments.

### NEW QUESTION # 54

An administrator is following the concept of least privilege and must configure permissions in a vSphere environment granting members of the group corp\VM-Managers the following abilities:

- \* Power on/off virtual machines
- \* Open consoles
- \* Create snapshots

Which out-of-the-box role satisfies these access control requirements?

- A. Virtual Machine Power User
- B. Administrator
- C. Virtual Machine User
- D. Virtual Machine Console User

**Answer: A**

Explanation:

The requirement is to follow least privilege while granting specific VM operations:

- \* Power on/off virtual machines
- \* Open consoles
- \* Create snapshots

The Virtual Machine Power User role is the correct out-of-the-box role, as it includes all these privileges without granting unnecessary administrative access.

Other roles:

- \* Administrator (A): Grants full environment control # too broad.
- \* Virtual Machine Console User (B): Limited to console access, cannot power on/off or snapshot.
- \* Virtual Machine User (C): Can interact with VMs but lacks snapshot privileges.
