VMware Cloud Foundation 9.0 Administrator Sample Questions (Q73-Q78):

NEW QUESTION # 73

Which command verifies the successful installation of the Tanzu CLI tools on a developer workstation?

- A. vcli --check
- B. vsphere -v
- C. vcli version

- **D. tanzu version**

Answer: D

Explanation:

To verify the successful installation of the Tanzu CLI tools, you can use the `tanzu version` command. This command displays the version of the Tanzu CLI, confirming that the tools are properly installed on the developer workstation.

NEW QUESTION # 74

Which two resources can be configured in a VM Class in VMware vSphere with vSphere Supervisor? (Choose two.)

- A. Storage
- B. Network interface
- **C. Memory**
- D. PCI devices
- **E. CPU**

Answer: C,E

Explanation:

A VM Class predefines hardware for Supervisor-managed VMs: "The VM class... defines such parameters as the number of virtual CPUs, memory capacity, and reservation settings." Administration steps show these are configurable: "You can configure hardware resources such as CPU, memory, and different devices" when editing a VM class.

Additionally, the DCUI/API specification underscores CPU and Memory fields: "--cpu-count ... Required." and "--memory-mb ... Required." for a VM class.

While network adapters, PCI devices, and instance storage can also be added via advanced config, the question asks for two; CPU and Memory are canonical, always-present VM Class resources per the core definition above.

NEW QUESTION # 75

What is the first step in downloading the vSphere CLI tools to a developer workstation?

- A. Configure the workstation's network settings to connect to the vSphere environment.
- B. Install a compatible version of Java Runtime Environment
- C. Register the developer workstation with the Active Directory.
- **D. Visit the VMware Downloads page and locate the vSphere CLI tools.**

Answer: D

Explanation:

The first step in downloading the vSphere CLI tools is to visit the VMware Downloads page, where the vSphere CLI tools are available. From there, you can select the appropriate version for your environment and begin the download process.

NEW QUESTION # 76

An administrator needs to deploy a Kubernetes cluster on a vSphere IaaS control plane (formerly vSphere with Tanzu) to host a new application.

Which three steps should be followed to successfully deploy the Kubernetes cluster? (Choose three.)

- **A. Configure a vSphere Namespace and assign resource quotas.**
- B. Create a new VM template for the Kubernetes nodes.
- **C. Enable Workload Management on the vSphere Cluster.**
- **D. Configure a Load Balancer for the Kubernetes control plane nodes.**
- E. , Deploy a vSphere Pod Service.

Answer: A,C,D

Explanation:

A Load Balancer is needed for the Kubernetes control plane nodes to distribute traffic across the control plane and ensure high availability for the Kubernetes management layer.

A vSphere Namespace must be configured to define a logical boundary for Kubernetes workloads, and resource quotas help ensure that resources are allocated appropriately for the workloads.

Enabling Workload Management on the vSphere Cluster is necessary to integrate Kubernetes with vSphere and manage the lifecycle of Kubernetes clusters using vSphere with Tanzu.

NEW QUESTION # 77

An administrator is deploying a new VCF instance in an existing fleet. Which three components must be deployed? (Choose three.)

- A. vCenter
- B. VCF Automation
- C. vSphere Supervisor
- D. NSX Manager
- E. SDDC Manager
- F. VCF Installer

Answer: A,D,E

Explanation:

The VCF 9.0 Deployment Guide states:

"Each new VCF instance requires its own management domain consisting of vCenter Server, NSX Manager cluster, and SDDC Manager." vCenter (A) is required to manage ESXi hosts and clusters.

NSX Manager (D) provides software-defined networking for the instance.

SDDC Manager (E) is the lifecycle and management component central to each VCF instance.

Supervisor (B) is optional and only enabled if Kubernetes workloads are required. VCF Automation (C) is a separate solution, not part of the core instance bring-up. VCF Installer (F) is the deployment tool, not a persistent component. Thus, the correct components to deploy are vCenter, NSX Manager, and SDDC Manager.
