NEW QUESTION # 25

A customer is planning to utilize NSX-T Data Center security services while maintaining current security services providers. Which two features can help the customer achieve this kind of integration? (Choose two.)

- A. Gateway Firewall
- B. Distributed Firewall
- C. Guest Introspection
- D. Network Introspection
- E. Intrusion Detection

Answer: A,B

NEW QUESTION # 26

Which TraceFlow traffic type should an NSX administrator use for validating connectivity between App and DB virtual machines that reside on different segments?

- A. Anycast
- B. Unicast
- C. Multicast
- D. Broadcast

Answer: B

Explanation:

Unicast is the traffic type that an NSX administrator should use for validating connectivity between App and DB virtual machines that reside on different segments. According to the VMware documentation¹, unicast traffic is the traffic type that is used to send a packet from one source to one destination. Unicast traffic is the most common type of traffic in a network, and it is used for applications such as web browsing, email, file transfer, and so on². To perform a traceflow with unicast traffic, the NSX administrator needs to specify the source and destination IP addresses, and optionally the protocol and related parameters¹. The traceflow will show the path of the packet across the network and any observations or errors along the way³. The other options are incorrect because they are not suitable for validating connectivity between two specific virtual machines. Multicast traffic is the traffic type that is used to send a packet from one source to multiple destinations simultaneously². Multicast traffic is used for applications such as video streaming, online gaming, and group communication⁴. To perform a traceflow with multicast traffic, the NSX administrator needs to specify the source IP address and the destination multicast IP address¹. Broadcast traffic is the traffic type that is used to send a packet from one source to all devices on the same subnet². Broadcast traffic is used for applications such as ARP, DHCP, and network discovery. To perform a traceflow with broadcast traffic, the NSX administrator needs to specify the source IP address and the destination MAC address as FF:FF:FF:FF:FF:FF¹. Anycast traffic is not a valid option, as it is not supported by NSX Traceflow. Anycast traffic is a traffic type that is used to send a packet from one source to the nearest or best destination among a group of devices that share the same IP address. Anycast traffic is used for applications such as DNS, CDN, and load balancing.
