CompTIA Security+ Certification Exam Sample Questions (Q439-Q444):

NEW QUESTION # 439

One of a company's vendors sent an analyst a security bulletin that recommends a BIOS update. Which of the following vulnerability types is being addressed by the patch?

- A. Firmware
- B. Virtualization
- C. Operating system
- D. Application

Answer: A

Explanation:

Explanation

Firmware is a type of software that is embedded in hardware devices, such as BIOS, routers, printers, or cameras. Firmware controls the basic functions and operations of the device, and can be updated or patched to fix bugs, improve performance, or enhance security. Firmware vulnerabilities are flaws or weaknesses in the firmware code that can be exploited by attackers to gain unauthorized access, modify settings, or cause damage to the device or the network. A BIOS update is a patch that addresses a firmware vulnerability in the basic input/output system of a computer, which is responsible for booting the operating system and managing the communication between the hardware and the software. The other options are not types of vulnerabilities, but rather categories of software or technology.

NEW QUESTION # 440

An employee receives a text message from an unrecognized number claiming to be the Chief Executive Officer and asking the employee to purchase gift cards. Which of the following types of attacks describes this example?

- A. Watering-hole
- B. Phishing
- C. Disinformation
- **D. Impersonation**

Answer: D

Explanation:

Impersonation involves an attacker pretending to be a trusted individual, such as a CEO, to trick someone into taking an action - in this case, purchasing gift cards - often seen in social engineering attacks via text or email.

NEW QUESTION # 441

A company wants to protect a specialized legacy platform that controls the physical flow of gas inside of pipes. Which of the following environments does the company need to secure to best achieve this goal?

- A. SDN
- B. IoT
- **C. SCADA**
- D. IaaS

Answer: C

Explanation:

Systems that control physical industrial processes-such as pumping gas, water control, electrical grids, or manufacturing lines-fall under SCADA (Supervisory Control and Data Acquisition) environments.

SCADA systems are part of larger OT (Operational Technology) infrastructures and manage sensors, actuators, valves, flow controls, and telemetry.

CompTIA Security+ SY0-701 explains that SCADA environments typically:

- * Use legacy protocols (e.g., Modbus, DNP3)
- * Require high availability
- * Often run outdated operating systems
- * Have control systems that cannot easily be patched
- * Require specialized segmentation and monitoring

This exactly matches the scenario describing a "specialized legacy platform controlling gas flow inside pipes." IaaS (A) is cloud infrastructure and unrelated to industrial control. SDN (C) relates to software-defined networking, not physical industrial controls. IoT (D) includes smart devices but is not typically used for large- scale industrial gas control.

Thus, securing SCADA is the correct answer.

NEW QUESTION # 442

A security administrator recently reset local passwords and the following values were recorded in the system:

Which of the following in the security administrator most likely protecting against?

- A. Weak password complexity
- B. Account sharing
- **C. Pass-the-hash attacks**
- D. Password compromise

Answer: C

Explanation:

The scenario shows MD5 hashed password values. The most likely reason the security administrator is focusing on these values is to protect against pass-the-hash attacks. In this type of attack, an attacker can use a captured hash to authenticate without needing to know the actual plaintext password. By managing and monitoring these hashes, the administrator can implement strategies to mitigate this type of threat.

NEW QUESTION # 443

A security analyst locates a potentially malicious video file on a server and needs to identify both the creation date and the file's creator. Which of the following actions would most likely give the security analyst the information required?

- A. Check endpoint logs.
- B. Obtain the file's SHA-256 hash.
- C. Query the file's metadata.
- D. Use hexdump on the file's contents.

Answer: C

Explanation:

Metadata is data that describes other data, such as its format, origin, creation date, author, and other attributes. Video files, like other types of files, can contain metadata that can provide useful information for forensic analysis. For example, metadata can reveal the camera model, location, date and time, and software used to create or edit the video file. To query the file's metadata, a security analyst can use various tools, such as MediaInfo, fprobe, or hexdump, to extract and display the metadata from the video file. By querying the file's metadata, the security analyst can most likely identify both the creation date and the file's creator, as well as other relevant information. Obtaining the file's SHA-256 hash, checking endpoint logs, or using hexdump on the file's contents are other possible actions, but they are not the most appropriate to answer the question. The file's SHA-256 hash is a cryptographic value that can be used to verify the integrity or uniqueness of the file, but it does not reveal any information about the file's creation date or creator. Checking endpoint logs can provide some clues about the file's origin or activity, but it may not be reliable or accurate, especially if the logs are tampered with or incomplete. Using hexdump on the file's contents can show the raw binary data of the file, but it may not be easy or feasible to interpret the metadata from the hex output, especially if the file is large or encrypted.
