## Salesforce Mule-Dev-202 Reliable Braindumps Book & Test Mule-Dev-202 Questions Vce

Our Mule-Dev-202 study materials are the hard-won fruit of our experts with their unwavering efforts in designing products and choosing test questions. Pass rate is what we care for preparing for an examination, which is the final goal of our Mule-Dev-202 study materials. According to the feedback of our users, we have the pass rate of 99%, which is equal to 100% in some sense. The high quality of our products also embodies in its short-time learning. You are only supposed to practice Mule-Dev-202 Study Materials for about 20 to 30 hours before you are fully equipped to take part in the examination.

## Salesforce Certified MuleSoft Hyperautomation Developer Sample Questions (Q23-Q28):

### NEW QUESTION # 23

An RPA process is invoked by a MuleSoft Composer flow. The RPA process has a User Task that can take up to 24 hours to complete.

- A. Using best practices, how should the results be consumed by MuleSoft Composer?
- B. Create a second MuleSoft Composer flow that starts when the RPA process is complete.**
- C. Wait for the RPA process to complete and invoke a second MuleSoft Composer flow via REST API.
- D. Create a second MuleSoft Composer flow that runs on a schedule and checks if the RPA process is complete.
- E. Wait for the RPA process to complete and use the results in the same MuleSoft Composer flow.

Answer: B

Explanation:

When an RPA process involves a User Task that can take a significant amount of time (up to 24 hours) to complete, it is best to use a follow-up mechanism to handle the results once the process is finished:

Second MuleSoft Composer Flow:

Create a second MuleSoft Composer flow that is triggered when the RPA process completes. This ensures that the first flow is not held up while waiting for the long-running RPA process to finish.

The second flow can start based on an event, such as the completion status of the RPA process, ensuring timely and efficient processing of the results.

Trigger Mechanism:

Configure the RPA process to notify MuleSoft Composer when it is complete, possibly using a REST API or another integration method.

Best Practices:

This approach adheres to best practices by keeping flows modular and focused on specific tasks, making them easier to manage and troubleshoot.

### NEW QUESTION # 24

Northern Trail Outfitters is concerned about security in their Salesforce org regarding their newly created hyperautomation flow that calls a MuleSoft API. A mechanism needs to be implemented that restricts which users can invoke the flow.

Which setting is available to a hyperautomation practitioner that meets this security requirement?

- A. Assign an appropriate profile or permission set to users in the external service.
- B. Configure OAuth 2.0 in the connected app.
- C. Assign an appropriate profile or permission set to users in the connected app.
- D. Configure OAuth 2.0 in the external service.

**Answer: C**

Explanation:

Profiles and Permission Sets: Assigning the appropriate profile or permission set to users in the connected app restricts access to the MuleSoft API. This method ensures that only authorized users can invoke the hyperautomation flow.

Reference: Salesforce Connected App Security

OAuth 2.0 Configuration: Configuring OAuth 2.0 is important for authentication, but it does not directly control which users can invoke the flow. The profile or permission set is used to manage user permissions.

Reference: OAuth 2.0 Overview

External Service Permissions: Assigning permissions in the external service is less relevant than managing permissions within Salesforce, where the flow is executed.

Reference: External Services in Salesforce

Connected App Security: Properly securing the connected app by configuring user profiles and permission sets ensures compliance with security policies and restricts access as required.

Reference: Managing Access with Connected Apps

### NEW QUESTION # 25

The current date and time is September 28, 2022, at 9:00 a.m.

A process running in a single Secured Session is scheduled to start September 28, 2022, at 10:00 a.m., and run every 45 minutes.

If the process takes one hour to complete when it runs for the first time, when will it run for the second time?

- A. September 28, 2022, at 11:30 a.m.
- B. September 28, 2022, at 10:30 a.m.
- C. September 28, 2022, at 10:45 a.m.
- D. After the first execution is complete

**Answer: D**

Explanation:

The process running in a single Secured Session is scheduled to start at 10:00 a.m. and run every 45 minutes.

If the process takes one hour to complete the first time, it will start the next run only after the current execution finishes because it's

within a single secured session:

First Run:

Scheduled to start at 10:00 a.m.

Takes 1 hour to complete, finishing at 11:00 a.m.

Next Run:

Since the first run takes 1 hour, the next execution can only start after the first one completes.

The subsequent run will then start 45 minutes after the completion of the first run, which is at 11:00 a.m. + 45 minutes = 11:45 a.m.

So, the process will run for the second time at 11:45 a.m.

### NEW QUESTION # 26

AnyAirlines releases a new REST API that exposes access to an RPA process. The RPA process can only handle a limited number of interactions per second before the API begins returning errors.

Which policy should AnyAirlines apply to prevent the API from being overloaded?

- A. Spike Control
- B. Client ID Enforcement
- C. JSON threat protection
- D. Rate Limiting - SLA

**Answer: A**

Explanation:

To prevent an API from being overloaded, the Spike Control policy is suitable. It helps manage sudden bursts of traffic by limiting the rate at which requests are processed. Here's how it works:

Preventing Overloads:

Spike Control smooths out bursts of incoming requests by enforcing a rate limit over a short period, protecting the backend systems from being overwhelmed by excessive traffic.

Configuration:

Apply the Spike Control policy to the API to define the maximum number of requests allowed within a specific timeframe.

This ensures that the API can handle a limited number of interactions per second, preventing errors due to overload.

Implementation:

In Anypoint Platform, configure the Spike Control policy to the desired thresholds, ensuring the RPA process can handle the load effectively without errors.

Anypoint Platform Spike Control Documentation

### NEW QUESTION # 27

Which Connected App scope should be used to connect RPA Manager with an Anypoint Platform account?

- A. API Catalog Contributor
- B. Exchange Administrator
- C. Application Creator
- D. RPA Integrator

**Answer: D**

Explanation:

To connect RPA Manager with an Anypoint Platform account, the appropriate Connected App scope is RPA Integrator:

RPA Integrator Scope:

The RPA Integrator scope is designed to provide the necessary permissions for integrating RPA Manager with Anypoint Platform.

This scope allows the connected app to interact with the RPA Manager and manage RPA processes.

Connected App Configuration:

When setting up a connected app in Anypoint Platform, select the RPA Integrator scope to ensure that the integration can access and manage the RPA processes as required.
