## Reguler InsuranceSuite-Analyst Update & InsuranceSuite-Analyst Reliable Exam Topics

For exam applicants Dumps4PDF offers real Guidewire InsuranceSuite-Analyst exam questions. There are three formats of the

Associate Certification - InsuranceSuite Analyst - Mammoth Proctored Exam (InsuranceSuite-Analyst) practice material. These formats are PDF, desktop practice exam software, and web-based Associate Certification - InsuranceSuite Analyst - Mammoth Proctored Exam (InsuranceSuite-Analyst) practice exam. With these questions, you can crack the Guidewire InsuranceSuite-Analyst certification exam and save your time and money.

## Guidewire Associate Certification - InsuranceSuite Analyst - Mammoth Proctored Exam Sample Questions (Q93-Q98):

### NEW QUESTION # 93

A commercial general liability insurer is initiating a new Guidewire implementation.

What are the primary advantages of leveraging Guidewire's standard user story cards during the initial phases of this project? Choose 2 options.

- A. Automating all data migration activities effectively
- B. Eliminating the need for custom configuration during the development sprint 0
- C. Providing definitive, unchangeable project estimates from day one
- **D. Accelerating the requirements gathering process and expediting user story reviews**
- E. Finalizing detailed design specifications for integrations
- **F. Reducing overall development effort by maximizing functional alignment**

**Answer: D,F**

Explanation:

The correct answers are A and C because Guidewire's standard user story cards are intended to help project teams begin with a structured, proven foundation for requirements discussion and scope alignment. In the early phases of an implementation, these story cards help the team move faster by giving business and project stakeholders a common starting point for reviewing functionality, discussing needs, and identifying where standard product capabilities already support the insurer's goals.

A). Accelerating the requirements gathering process and expediting user story reviews is correct because standard user story cards reduce the need to create every story from scratch. They help analysts and stakeholders review pre-identified functional areas more efficiently, allowing workshops and elaboration sessions to focus on confirmation, refinement, and prioritization rather than blank-page discovery.

C). Reducing overall development effort by maximizing functional alignment is also correct because these standard stories are based on Guidewire product capabilities and common insurance processes. When the team uses them effectively, they are better positioned to align requirements with out-of-the-box functionality, which can reduce unnecessary customization and lower implementation effort. The other options are not valid advantages of standard user story cards. They do not automate data migration, finalize detailed integration designs, guarantee fixed estimates from the start, or eliminate the need for configuration. Those outcomes either belong to other disciplines or overstate what user story cards are meant to provide.

So, the main value of Guidewire standard user story cards in the initial project phases is that they speed up requirements work and promote closer alignment to standard functionality, which in turn supports a more efficient implementation.

### NEW QUESTION # 94

An example of a tool built by Guidewire Professional Services to support implementation projects is:

- A. Requirement
- B. Guiding principle
- **C. User story card**
- D. Business objective

**Answer: C**

Explanation:

The User Story Card is a key tool developed and standardized by Guidewire Professional Services to support InsuranceSuite implementation projects, making Option A the correct answer.

User story cards provide a structured, consistent way to capture requirements using an Agile approach aligned with SurePath methodology. They define business intent, acceptance criteria, and scope boundaries in a format that supports elaboration, estimation, development, and testing.

The remaining options are not tools. Requirements (Option B), business objectives (Option C), and guiding principles (Option D) are types of content, not standardized delivery tools.

User story cards enable consistent communication across analysts, developers, and testers and are central to successful Guidewire implementations.

### NEW QUESTION # 95

Which team members are part of the Three Amigos meeting? (Select two)

- A. Business Analyst
- B. Quality Analyst
- C. Project Manager
- D. Subject Matter Expert
- E. Scrum Master

**Answer: A,B**

Explanation:

The Three Amigos meeting is a key Agile practice used in Guidewire projects to clarify user stories before development begins. It ensures shared understanding across execution roles and reduces defects caused by misinterpretation.

Two of the required participants in a Three Amigos session are the Business Analyst and the Quality Analyst, making Options A and B correct.

The Business Analyst represents business intent and functional requirements. They explain the user story, business rules, validations, and expected behavior.

The Quality Analyst represents the testing perspective. They focus on acceptance criteria, edge cases, and how the story will be validated to determine when it is "done." While Developers are typically the third "Amigo" in practice, they are not listed as an option in this question.

The Project Manager and Scrum Master facilitate delivery but do not play the execution-focused role of an Amigo. Subject Matter Experts provide input during elaboration but are not core participants in Three Amigos sessions.

### NEW QUESTION # 96

Knowing application logic helps non-developers define and document the business logic requirements for: (Choose two)

- A. Application processing flow
- B. Data dictionaries
- C. APIs
- D. Rule conditions and actions

**Answer: A,D**

Explanation:

A basic understanding of application logic enables non-developers—such as Business Analysts—to effectively define and document how the system should behave in response to business scenarios. The correct answers are Options B and D.

Understanding application logic helps analysts define the application processing flow (Option B). This includes how data moves through the system, when activities are created, how statuses change, and what actions are triggered at various points in a workflow.

Analysts use this knowledge to document future-state processes and ensure Guidewire supports end-to-end business scenarios.

It also helps analysts clearly define rule conditions and actions (Option D). Analysts frequently specify when a rule should apply and what outcome should occur, such as assigning work, displaying messages, or enforcing validations. While developers implement these rules in Gosu, analysts must document the business logic accurately.

The remaining options are less relevant. Data dictionaries (Option A) describe data structures rather than behavior. APIs (Option C) are technical integration constructs typically designed by developers and architects.

By understanding application logic concepts, analysts produce clearer, more actionable requirements that reduce ambiguity and improve implementation quality.

### NEW QUESTION # 97

When a new requirement for a commercial general liability product necessitates a change to the Guidewire data model, business analysts are responsible for defining the requirements for \_\_\_\_\_ and \_\_\_\_\_ that the base application does not store.

- A. External system connections, batch processing schedules
- B. Database table structures, complex logic extensions
- C. System performance metrics, security access roles
- D. New type values, additional entity fields

- E. Core entity relationships, database indexing
- F. Integration data mapping, user interface mockups

**Answer: D**

Explanation:

When Guidewire InsuranceSuite requires a data model change, Business Analysts play a key role in defining what new data must be stored to support business requirements. The correct answer is Option B: new typelist values and additional entity fields. Business Analysts are responsible for identifying new business data elements that are not available in the out-of-the-box product. This often includes defining new typelist values to represent controlled sets of business options, such as classifications, statuses, or categories. Typelists ensure data consistency and usability across rules, UI, and integrations. Analysts also define requirements for additional entity fields. These fields store new information such as dates, indicators, or free-text notes that support the business process. Analysts specify the business meaning, usage, and constraints of these fields, while developers implement the technical changes. The remaining options fall outside the analyst's responsibility. Performance metrics, security roles, database indexing, table structures, and complex logic are technical or architectural concerns handled by developers or architects. Integration mapping and UI mockups may involve analysts, but they do not define changes to the data model itself. By focusing on typelists and entity fields, Business Analysts ensure the Guidewire data model evolves in a controlled, business-driven manner that supports functionality without unnecessary technical complexity.

## NEW QUESTION # 98

.....

Do you want to find a good job which brings you high income? Do you want to be an excellent talent? The InsuranceSuite-Analyst certification can help you realize your dream which you long for because the InsuranceSuite-Analyst test prep can prove that you own obvious advantages when you seek jobs and you can handle the job very well. So our InsuranceSuite-Analyst Exam Preparation can be conducive to helping you pass the InsuranceSuite-Analyst exam and find a good job. What are you waiting for? Just come and buy our InsuranceSuite-Analyst exam questions!
