

# JN0-481 Valid Test Duration, Valid JN0-481 Exam Vce

P.S. Free 2026 Juniper JN0-481 dumps are available on Google Drive shared by PrepAwayETE: <https://drive.google.com/open?id=1gsq2e5jIDxUBqEYfLWYf2fWjEP3ZOaOJ>

This JN0-481 certification assists you to put your career on the right track and helps you to achieve your career goals in a short time period. There are several personal and professional benefits that you can gain after passing the Data Center, Specialist (JNCIS-DC) (JN0-481) certification exam. The prominent JN0-481 certification benefits include validation of skills and knowledge, more career opportunities, instant rise in salary, quick promotion, etc.

PrepAwayETE JN0-481 exam certification training materials is not only the foundation for you to success, but also can help you play a more effective role in the IT industry. With efforts for years, the passing rate of PrepAwayETE JN0-481 Certification Exam has reached as high as 100%. If you failed JN0-481 exam with our JN0-481 exam dumps, we will give a full refund unconditionally

## Valid JN0-481 Exam Vce, Valid JN0-481 Mock Test

Candidates who crack the JN0-481 examination of the Juniper JN0-481 certification validate their worth in the sector of information technology. The Juniper JN0-481 credential is evidence of their talent. Reputed firms hire these talented people for high-paying jobs. To get the Data Center, Specialist (JNCIS-DC) (JN0-481) certification, it is essential to clear the Data Center, Specialist (JNCIS-DC) (JN0-481) test. For this task, you need to update Data Center, Specialist (JNCIS-DC) (JN0-481) preparation material to get success.

## Juniper Data Center, Specialist (JNCIS-DC) Sample Questions (Q36-Q41):

### NEW QUESTION # 36

Which attribute enables Juniper Apstra to scale and manage thousands of devices with a single server instance?

- A. Apstra is available as an OVA.
- B. Apstra is based on NGINX.
- C. Apstra is installed as a cloud resource.
- D. Apstra is a distributed state system.

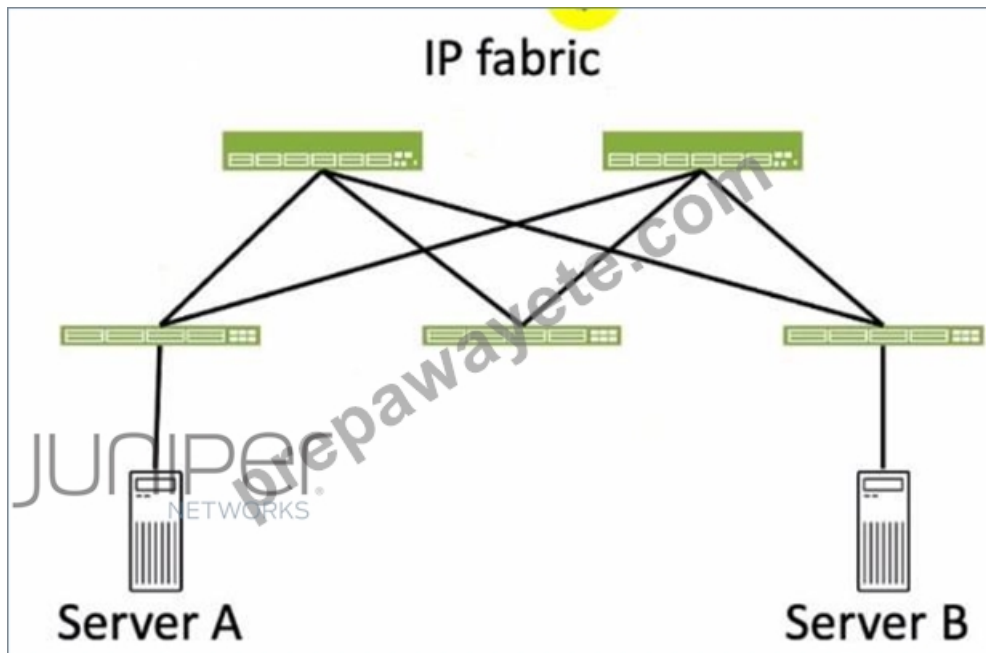

**Answer: D**

Explanation:

The attribute that enables Juniper Apstra to scale and manage thousands of devices with a single server instance is that Apstra is a distributed state system. This means that Apstra uses a graph database to store the network topology and configuration data in a distributed and replicated manner across multiple server nodes. This allows Apstra to handle large-scale networks with high performance, reliability, and availability. Apstra also uses a stateful orchestration engine that ensures the network state is always consistent with the intent of the blueprint, which is the logical representation of the network design and behavior. Apstra can automatically detect and resolve any discrepancies between the desired and actual network state, as well as handle any changes or failures in the network.

#### NEW QUESTION # 37

Referring to the exhibit, how many broadcast domains will an Ethernet frame pass through when traversing the IP fabric from Server A to Server B?

- A. 0
- **B. 1**
- C. 2
- D. 3

**Answer: B**

Explanation:

Referring to the exhibit, the image shows a simplified diagram of an IP fabric network connecting two servers, labeled as Server A and Server B. The IP fabric is a network architecture that uses a Clos topology to provide high bandwidth, low latency, and scalability for data center networks.

The IP fabric consists of spine and leaf devices that use BGP as the routing protocol and VXLAN as the overlay technology.

A broadcast domain is a logical portion of a network where any device can directly transmit broadcast frames to other devices at the data link layer (OSI Layer 2). A broadcast frame is a frame that has a destination MAC address of all ones (FF:FF:FF:FF:FF:FF), which means that it is intended for all devices in the same broadcast domain. A broadcast domain is usually bounded by a router, which does not forward broadcast frames to other networks.

In the exhibit, there are two broadcast domains that an Ethernet frame will pass through when traversing the IP fabric from Server A to Server B. The first broadcast domain is the one that contains Server A and the leaf device that it is connected to. The second broadcast domain is the one that contains Server B and the leaf device that it is connected to. The IP fabric itself is not a broadcast domain, because it uses IP routing and VXLAN encapsulation to transport the Ethernet frames over the Layer 3 network.

#### NEW QUESTION # 38

Which statement is correct about making changes to a predefined device profile in Juniper Apstra?

- A. The processor load on the Apstra server will be negatively impacted when changes are made to a predefined device profile.
- B. You must reboot the Apstra server after changes are made to a predefined device profile before they will become active.
- C. The changes you make to a predefined device profile will be discarded and overwritten when upgrading the Apstra server version.
- D. Changing the predefined device profile will also affect deployed devices that use the same profile.

**Answer: C**

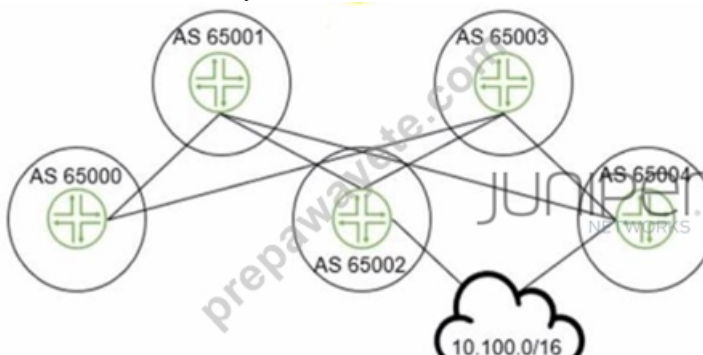

Explanation:

A predefined device profile is a configuration template that is shipped with Apstra software and supports most qualified Juniper devices. A predefined device profile cannot be changed, since any changes would be discarded and overwritten when you upgrade the Apstra server version. If you want to customize a predefined device profile, you can clone and edit it instead.

### NEW QUESTION # 39

The 10.100.0.0/16 route is being advertised into your BGP IP fabric. ECMP load balancing has been properly enabled on all devices.

In this scenario, how many routes will the leaf device in AS 65000 receive for the 10.100.0.0/16 prefix?

- A. 0
- B. 1
- C. 2
- D. 3

**Answer: A**

Explanation:

The leaf device in AS 65000 will receive three routes for the 10.100.0.0/16 prefix, one from each spine device in AS 65001, AS 65002, and AS 65003. Since ECMP load balancing is enabled, the leaf device will install all three routes in its routing table and distribute the traffic among them.

### NEW QUESTION # 40

In the Juniper Apstra UI, which two resource types would be created in the Resources menu? (Choose two.)

- A. bridge domain identifier (BDI)
- B. IP pools
- C. ASN pools
- D. DHCP pools

**Answer: B,C**

Explanation:

The Resources menu in the Juniper Apstra UI allows you to create and manage various types of resources that are assigned to different elements of the network.

Resources include the following types:

- IPv4 (including Host IPv4)
- IPv6 (including Host IPv6)

- ASN (autonomous system number)
- VNI (virtual network identifier)
- VLAN (virtual local area network)

Integer (used for pool type VLAN in local pools in Freeform blueprints) Therefore, the correct answer is C and D. ASN pools and IP pools are two types of resources that can be created in the Resources menu. Bridge domain identifier (BDI) and DHCP pools are not applicable in this scenario, because they are not part of the resources types supported by Juniper Apstra.

## NEW QUESTION # 41

.....

There are multiple choices on the versions of our JN0-481 learning guide to select according to our interests and habits since we have three different versions of our JN0-481 exam questions: the PDF, the Software and the APP online. The Software and APP online versions of our JN0-481 preparation materials can be practiced on computers or phones. They are new developed for the reason that electronics products have been widely applied to our life and work style. The PDF version of our JN0-481 Actual Exam supports printing, and you can practice with papers and take notes on it.
