Three statements that describe Transmission Control Protocol?

- Uses a best effort delivery approach
- had delivery notification and error-checking mechanisms
- applications include HTTP and SMTP
- TCP is faster than User Datagram Protocol (UDP)
- TCP is a transport layer protocol - has delivery notification and error-checking, applications include HTTP and SMTP
- TCP is transport layer protocol

Two benefits of the disaggregated JUNOS OS?

- A-The Junos VM becomes hardware-independent and can be deployed on any hypervisor without modifications.
- B-Platform drivers and forwarding engine are removed from the control plane to increase performance.
- C-Increased flexibility to use different control plane versions
- D-The architecture facilitates programmability through provisioning the control plane, the data path and the platform API - B and D

Describes the connection between control plane and forwarding plane

- No rate limiter is configured by default
 - control traffic is preferred over exception traffic during congestion
 - A rate limiter is configured by default
 - Exception traffic is preferred over control traffic during congestion - Control traffic is preferred, a rate-limiter is configured by default
- The JUNOS OS sends all exception traffic destined for the RE over the internal link that connects the control and forwarding plane. The JUNOS OS rate limits the exception traffic traversing the internal link to protect the RE from DOS attacks. During congestion preference is given to local and control traffic destined for the RE

A packet enters a JUNOS device. No matching destination entry exists in the forwarding table. How will the device respond? - The PFE responds to the source with a destination unreachable message. The PFE, not the RE

Two examples of transit traffic:

- A-SCP traffic destined for the router's loopback interface
- B-SFTP traffic that enters and exits the same interface on a local router
- C-SCP traffic that enters one interface and exits another on a local router

Juniper Junos, Associate (JNCIA-Junos) Sample Questions (Q29-Q34):

NEW QUESTION # 29

Which two statements are true about the PFE? (Choose two.)

- A. The PFE uses Layer 2 and Layer 3 forwarding tables to forward traffic toward its destination.
- B. The PFE is responsible for performing protocol updates and system management.
- C. The PFE handles all processes that control the chassis components.
- D. The PFE implements various services such as policing, stateless firewall filtering, and class of service.

Answer: A,D

Explanation:

The Packet Forwarding Engine (PFE) in Juniper Networks devices is the heart of the data plane, handling the actual forwarding of packets based on pre-computed forwarding tables. It provides several critical services to manage and control traffic flow, including policing (to enforce bandwidth limits for certain traffic types), stateless firewall filtering (to permit or deny traffic based on predefined criteria), and Class of Service (CoS) (to prioritize traffic to ensure quality of service for critical applications). The PFE utilizes both Layer 2 (MAC addresses) and Layer 3 (IP addresses) forwarding tables to make intelligent forwarding decisions, ensuring that packets are efficiently routed toward their final destination.

NEW QUESTION # 30

How many rescue configuration files are supported on a Junos device?

- A. 0
- B. 1
- C. 2
- D. 3

Answer: C

Explanation:

Junos OS supports only 1 rescue configuration file on a device. This rescue configuration is a safeguard feature that allows network administrators to revert to a known good configuration in case of a configuration error or issue, ensuring network stability.

NEW QUESTION # 31

What are two attributes of the UDP protocol? (Choose two.)

- A. UDP is more reliable than TCP.
- B. UDP is always slower than TCP.
- C. UDP is connectionless.
- D. UDP is best effort.

Answer: C,D

Explanation:

UDP (User Datagram Protocol) is known for being connectionless (D) and providing best-effort delivery without the reliability mechanisms present in TCP (C). This means that UDP does not establish a connection before sending data and does not guarantee delivery, order, or error checking, making it faster but less reliable than TCP.

NEW QUESTION # 32

Which character is used to filter the command output in the Junos CLI?

- A. >
- B. |
- C. ?
- D. <

Answer: B

Explanation:

In the Junos CLI, the pipe character | is used as a filter operator to refine command output. This operator can be combined with various filtering commands like match, except, count, etc., to display only the relevant portions of the command output. For example, using | match <pattern> filters the output to show only the lines that contain the specified pattern, making it easier to find specific information within extensive command output. This functionality is especially useful in managing and troubleshooting complex configurations and network states, allowing for more efficient analysis of the device's operational status and configuration details.

NEW QUESTION # 33

What are two functions of the routing protocol daemon (rpd)? (Choose two.)

- A. It generates chassis alarms.
- B. It maintains routing tables.
- C. It creates forwarding tables.
- D. It provides access to the CLI.

Answer: B,C

Explanation:

The Routing Protocol Daemon (rpd) is a critical component in Juniper Networks devices, responsible for all routing operations. It maintains routing tables, which hold information about network paths and destinations derived from various routing protocols. These tables are used to make decisions about where to send packets. Additionally, rpd generates forwarding tables based on the information in the routing tables. The forwarding tables are then used by the Packet Forwarding Engine (PFE) to actually forward packets to their next hop or final destination.
