## Salesforce Platform Developer II Sample Questions (Q42-Q47):

### NEW QUESTION # 42

When testing batch classes, what must a developer do? (Choose two.)

- A. Limit the amount of records you test to < 200
- B. Encapsulate code in `Test.startTestQ` and `Test.stopTestQ`

- C. Use seeAllData=true
- D. Call the class\* "execute" method

**Answer: A,B**

Explanation:

Explanation

If you use "seeAllData=true," you are a bad person

### NEW QUESTION # 43

A company has code to update a Request and Request Lines and make a callout to their external ERP system's REST endpoint with the updated records.

The callousUtil.makeRestCallout fails with a "You have uncommitted work pending. Please commit or rollback before calling cut' error.

What should be done to address the problem?

- A. Change the CallousUtil .makeRestCallout to an @future method.
- B. Change the callousUtil makeRestCallout to an @InvocsbIsMethod method.
- C. Remove the Database. setSavepoint and Database. rollback.

**Answer: A**

Explanation:

Changing the CalloutUtil.makeRestCallout to an @future method is a way to address the problem of the "You have uncommitted work pending. Please commit or rollback before calling out" error. This error occurs when a DML operation is performed before a callout to an external service, such as a REST endpoint. This is because the DML operation locks the database records and prevents them from being rolled back if the callout fails. To avoid this error, the developer can use the @future annotation to mark the CalloutUtil.makeRestCallout method as asynchronous, which means it will run in a separate thread after the DML operation is committed. This way, the DML operation and the callout will not interfere with each other, and the error will be resolved. Reference: [Asynchronous Apex], [Making Callouts]

### NEW QUESTION # 44

Which use case can be performed only by using asynchronous Apex?

- A. Updating a record after the completion of an insert
- B. Making a call to schedule a batch process to complete in the future
- C. Querying tens of thousands of records
- D. Calling a web service from an Apex trigger

**Answer: D**

### NEW QUESTION # 45

Universal Containers is leading a development team that follows the source-driven development approach in Salesforce. As part of their continuous integration and delivery (CI/CD) process, they need to automatically deploy changes to multiple environments, including sandbox and production.

Which mechanism or tool would best support their CI/CD pipeline in source-driven development?

- A. Salesforce CLI with Salesforce DX
- B. Ant Migration Tool
- C. Salesforce Extensions for Visual Studio Code
- D. Change Sets

**Answer: A**

Explanation:

Salesforce CLI with Salesforce DX is a mechanism or tool that can best support the CI/CD pipeline in source-driven development. Salesforce CLI is a command-line interface that can be used to create, manage, and deploy Salesforce projects and orgs. Salesforce DX is a set of tools and features that can be used to enable source-driven development, team collaboration, and agile delivery on the

Lightning Platform. By using Salesforce CLI with Salesforce DX, the developer can automate the deployment of changes to multiple environments, including sandbox and production, using scripts, commands, and metadata. Salesforce CLI with Salesforce DX can also integrate with other CI/CD tools and services, such as Jenkins, Git, or Heroku. Reference: [Salesforce CLI], [Salesforce DX]

#### NEW QUESTION # 46

How should a developer assert that a trigger with an asynchronous process has successfully run?

- A. Create all test data, use @future in the test class, then perform assertions.
- B. Insert records into Salesforce, use seeAllData=true, then perform assertions.
- C. Create all test data in the test class, use System.runAs() to invoke the trigger, then perform assertions.
- **D. Create all test data in the test class, invoke Test.startTest() and Test.stopTest() and then perform assertions.**

**Answer: D**

Explanation:

Testing asynchronous Apex (such as @future methods, Batchable, or Queueable classes) requires a specific mechanism to ensure that background tasks complete before the test verifies the results. In a standard execution, asynchronous jobs are queued and run whenever system resources are available, which means a test's assertion statements might execute before the background job has even started. To address this, Salesforce provides the Test.startTest() and Test.stopTest() methods. When the code that initiates an asynchronous process is placed between Test.startTest() and Test.stopTest(), the platform behaves differently. All asynchronous calls made within this block are collected and held by the system. As soon as the code reaches Test.stopTest(), the test execution pauses, and the system forces all queued asynchronous jobs to run immediately and synchronously within the same thread. Once Test.

stopTest() finishes, the execution continues to the next line. By placing assertions immediately after Test.

stopTest(), the developer is guaranteed that the asynchronous logic has finished its work. This is the only supported way to reliably test the side effects of background processes. Other options, like using System.

runAs() or seeAllData=true, do not affect the timing of asynchronous execution and will likely result in failed assertions.
