NEW QUESTION # 63

If a Dockerfile contains the following lines:

```
WORKDIR /
```

```
RUN cd /tmp
```

```
RUN echo test > test
```

where is the filetest located?

- A. /tmp/test on the system running docker build.
- B. test in the directory holding the Dockerfile.
- C. /tmp/test within the container image.

- D. /root/test within the container image.
- E. /test within the container image.

Answer: E

Explanation:

Explanation

The WORKDIR instruction sets the working directory for any subsequent RUN, CMD, ENTRYPOINT, COPY and ADD instructions that follow it in the Dockerfile¹. The RUN instruction executes commands in a new layer on top of the current image and commits the results². The RUN cd command does not change the working directory for the next RUN instruction, because each RUN command runs in a new shell and a new environment³. Therefore, the file test is created in the root directory (/) of the container image, not in the /tmp directory. References:

NEW QUESTION # 64

Which of the following values are valid in the firmware attribute of a <os> element in a libvirt domain definition? (Choose two.)

- A. bios
- B. efi
- C. virtio
- D. pcie
- E. scsi

Answer: A,B

NEW QUESTION # 65

What is the typical format for cloud-init configuration files?

- A. .xml
- B. .yaml
- C. .ini
- D. .json

Answer: B

Explanation:

Cloud-init configuration files are typically written in YAML (Yet Another Markup Language) format.

Official cloud-init documentation specifies that cloud-config files use YAML syntax, which is human-readable and well suited for declarative configuration.

YAML files allow administrators to define users, packages, services, networking, and commands in a structured and consistent way.

While cloud-init can process shell scripts and MIME multipart data, YAML remains the standard and recommended format.

Thus, the correct answer is D.

NEW QUESTION # 66

In order to determine if a virtualization host offers Intel VT-x support, which CPU flag must be searched for in the file /proc/cpuinfo?

Answer:

Explanation:

vmx

Explanation:

Intel VT-x is Intel's hardware-assisted virtualization technology and is required to run hypervisors such as KVM efficiently.

According to Linux and KVM documentation, support for Intel VT-x can be verified by checking the CPU flags listed in the /proc/cpuinfo file.

The specific flag that indicates Intel VT-x support is vmx. This flag appears in the flags section for each processor core if VT-x is available and enabled in the system firmware (BIOS or UEFI). The presence of vmx confirms that the CPU supports hardware

virtualization extensions required by KVM.

If the flag is absent, virtualization may either be unsupported by the CPU or disabled in the firmware settings.

For AMD processors, a different flag (svm) is used.

Virtualization documentation consistently references the vmx flag as the authoritative indicator for Intel VT-x support. Therefore, the correct and documented answer is vmx.

NEW QUESTION # 67

Which of the following statements are true of full virtualization? (Select THREE correct answers)

- A. Full virtualization requires time and system resources for emulation
- B. Full virtualization requires no modification to the Guest OS kernel
- C. Full virtualization works through CPU emulation
- D. Full virtualization is faster than paravirtualization
- E. Full virtualization has superior I/O performance through emulated device drivers

Answer: A,B,C

Explanation:

Full virtualization allows unmodified guest operating systems to run in virtual machines, making statement B correct. The hypervisor presents a complete hardware abstraction to the guest OS.

Historically and conceptually, full virtualization relies on CPU emulation or hardware-assisted virtualization, making statement C correct. Even with hardware extensions, some degree of emulation is involved.

Full virtualization also requires additional system resources and processing time to emulate hardware and manage isolation, making statement E correct.

Statement A is incorrect because paravirtualization often offers better performance. Statement D is incorrect because emulated I/O devices generally perform worse than paravirtualized drivers.

Therefore, the correct answers are B, C, and E.
