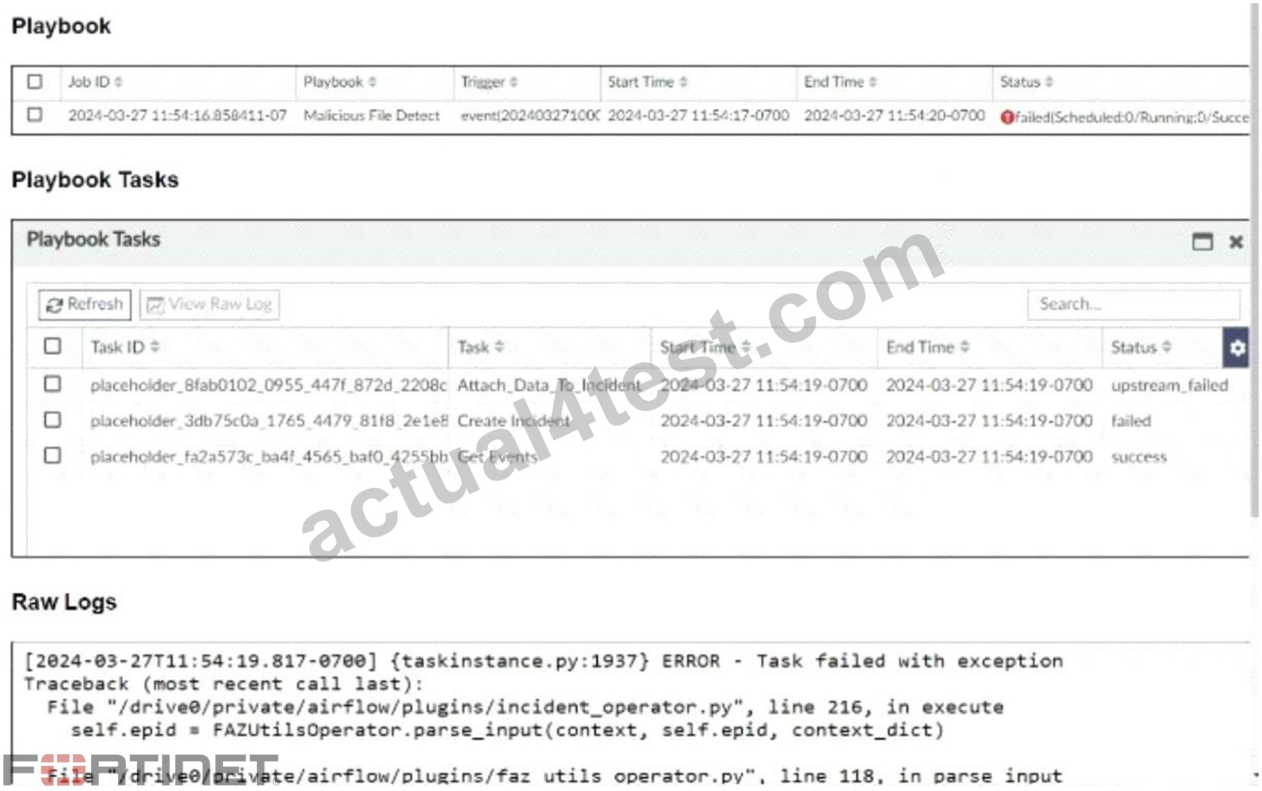
NEW QUESTION # 47
What is the primary function of event handlers in a SOC operation?

- A. To provide technical support to end-users
- B. To monitor the health of IT equipment
- C. To automate responses to detected events
- D. To generate financial reports

Answer: C

NEW QUESTION # 48
Refer to the exhibits.



The Malicious File Detect playbook is configured to create an incident when an event handler generates a malicious file detection event.
Why did the Malicious File Detect playbook execution fail?

- A. The Attach_Data_To_Incident incident task wasexpecting an integer, but received an incorrect data format.
- B. The Get Events task did not retrieve any event data.
- C. The Attach Data To Incident task failed, which stopped the playbook execution.
- D. The Create Incident task was expecting a name or number as input, but received an incorrect data format

Answer: D

Explanation:
* Understanding the Playbook Configuration:
* The "Malicious File Detect" playbook is designed to create an incident when a malicious file detection event is triggered.
* The playbook includes tasks such asAttach_Data_To_Incident,Create Incident, andGet Events.
* Analyzing the Playbook Execution:
* The exhibit shows that theCreate Incidenttask has failed, and theAttach_Data_To_Incidenttask has also failed.
* TheGet Eventstask succeeded, indicating that it was able to retrieve event data.

* Reviewing Raw Logs:
* The raw logs indicate an error related to parsing input in theincident_operator.pyfile.
* The error traceback suggests that the task was expecting a specific input format (likely a name or number) but received an incorrect data format.
* Identifying the Source of the Failure:
* TheCreate Incidenttask failure is the root cause since it did not proceed correctly due to incorrect input format.
* TheAttach_Data_To_Incidenttask subsequently failed because it depends on the successful creation of an incident.
* Conclusion:
* The primary reason for the playbook execution failure is that theCreate Incidenttask received an incorrect data format, which was not a name or number as expected.

NEW QUESTION # 49
Which statement describes automation stitch integration between FortiGate and FortiAnalyzer?

- A. An automation stitch is configured on FortiAnalyzer and mapped to FortiGate using the FortiOS connector.
- B. An event handler on FortiAnalyzer is configured to send a notification to FortiGate to trigger an automation stitch.
- C. A security profile on FortiGate triggers a violation and FortiGate sends a webhook call to FortiAnalyzer.
- D. An event handler on FortiAnalyzer executes an automation stitch when an event is created.

Answer: C

Explanation:
Overview of Automation Stitches: Automation stitches in Fortinet solutions enable automated responses to specific events detected within the network. This automation helps in swiftly mitigating threats without manual intervention.
FortiGate Security Profiles:
FortiGate uses security profiles to enforce policies on network traffic. These profiles can include antivirus, web filtering, intrusion prevention, and more.
When a security profile detects a violation or a specific event, it can trigger predefined actions.
Webhook Calls:
FortiGate can be configured to send webhook calls upon detecting specific security events.
A webhook is an HTTP callback triggered by an event, sending data to a specified URL. This allows FortiGate to communicate with other systems, such as FortiAnalyzer. FortiAnalyzer Integration:
FortiAnalyzer collects logs and events from various Fortinet devices, providing centralized logging and analysis.
Upon receiving a webhook call from FortiGate, FortiAnalyzer can further analyze the event, generate reports, and take automated actions if configured to do so. Detailed Process:
Step 1: A security profile on FortiGate triggers a violation based on the defined security policies.
Step 2: FortiGate sends a webhook call to FortiAnalyzer with details of the violation.
Step 3: FortiAnalyzer receives the webhook call and logs the event.
Step 4: Depending on the configuration, FortiAnalyzer can execute an automation stitch to respond to the event, such as sending alerts, generating reports, or triggering further actions.
Reference: Fortinet Documentation: FortiOS Automation Stitches
FortiAnalyzer Administration Guide: Details on configuring event handlers and integrating with FortiGate.
FortiGate Administration Guide: Information on security profiles and webhook configurations.
By understanding the interaction between FortiGate and FortiAnalyzer through webhook calls and automation stitches, security operations can ensure a proactive and efficient response to security events.

- A. Web filter logs
- B. IPS logs
- C. Application filter logs
- D. DNS filter logs
- E. Email filter logs

Answer: A,B,D

Explanation:
* Overview of Indicators of Compromise (IoCs): Indicators of Compromise (IoCs) are pieces of evidence that suggest a system may have been compromised. These can include unusual network traffic patterns, the presence of known malicious files, or other suspicious activities.
* FortiAnalyzer's Role: FortiAnalyzer aggregates logs from various Fortinet devices to provide comprehensive visibility and analysis of network events. It uses these logs to identify potential IoCs and compromised hosts.
* Relevant Log Types:
* DNS Filter Logs:
* DNS requests are a common vector for malware communication. Analyzing DNS filter logs helps in identifying suspicious domain queries, which can indicate malware attempting to communicate with command and control (C2) servers.
