- E. SAP SuccessFactors

答案： B,C,D

問題 #27
How does SAP Business Data Cloud facilitate the use of diverse data sources for AI-powered analytics?

- A. By transforming raw data from diverse sources into a standardized format
- B. By integrating diverse data sources through custom APIs
- C. By centralizing data from both SAP and non-SAP sources into a unified semantic layer
- D. By providing a secure platform for storing and managing diverse data sets

答案： C

解題說明:
SAP Business Data Cloud (BDC) is a Software-as-a-Service (SaaS) solution that unifies and harmonizes data from SAP and non-SAP sources to enable advanced analytics and AI-driven insights. The question asks how SAP BDC facilitates the use of diverse data sources specifically for AI-powered analytics, with one correct answer. Below, each option is evaluated based on official SAP documentation and related materials, including SAP.com, SAP Learning, and web sources from the provided search results, ensuring alignment with the
"Positioning SAP Business Data Cloud" narrative.
* Option A: By centralizing data from both SAP and non-SAP sources into a unified semantic layerSAP BDC facilitates AI-powered analytics by centralizing data from SAP and non-SAP sources into a unified semantic layer, which preserves business context and ensures data consistency for advanced analytics and AI applications. This semantic layer is a core component of SAP BDC, enabling the platform to harmonize structured and unstructured data, making it readily accessible for AI and machine learning (ML) operations, such as those powered by SAP Databricks integration. The unified semantic layer is explicitly highlighted in SAP's documentation as the primary mechanism for enabling AI-powered analytics, as it provides a trusted data foundation that AI models can leverage for accurate and context-rich insights.Extract: "SAP Business Data Cloud is a data platform that harmonizes all data from SAP and non-SAP sources, into a unified semantic layer of trusted data, to power advanced analytics and AI. By integrating all types of cross-company data, which includes structured and non- structured data, businesses gain actionable intelligence to bridge transactional processes and drive AI- powered growth." Extract: "SAP Business Data Cloud is a fully managed SaaS solution that unifies and governs all SAP data and seamlessly connects with third-party data-giving line-of-business leaders context to make even more impactful decisions. ... Connect all your data: Harmonize all your mission- critical data with an open data ecosystem, leveraging a powerful semantic layer to give you an unmatched knowledge of your business." This option is correct.
* Option B: By transforming raw data from diverse sources into a standardized formatWhile SAP BDC does involve data transformation to ensure usability for analytics (e.g., through SAP Datasphere's data modeling capabilities), the process of transforming raw data into a standardized format is not the primary mechanism for facilitating AI-powered analytics. The emphasis in SAP BDC's architecture is on the unified semantic layer, which goes beyond standardization to include semantic enrichment and business context preservation. Standardization is a supporting function, but it is not explicitly highlighted as the key enabler for AI analytics in the documentation. The focus is on harmonization and integration into the semantic layer, making this option less accurate.Extract: "SAP Datasphere: This works as central component in BDC by creating consumption ready data models on top of Data Products while also managing analytical roles, access controls etc." This option is incorrect.
* Option C: By providing a secure platform for storing and managing diverse data setsSAP BDC does provide a secure platform for storing and managing data, leveraging features like SAP HANA Cloud and a data lakehouse architecture for governance and security. However, this capability is not the primary facilitator for AI-powered analytics. Security and data management are foundational requirements, but the documentation emphasizes the unified semantic layer and data harmonization as the key drivers for enabling AI analytics, rather than storage or management alone. This option is too general and does not directly address the AI analytics focus of the question.Extract: "SAP Business Data Cloud offers several capabilities for connecting and harmonizing data. By leveraging an SAP- managed Lakehouse, users can maintain rich business semantics for SAP-sourced data products right out-of-the-box. Additionally, the platform introduces a Data Foundation layer, which acts as a data lake to store both SAP and non-SAP data sources." This option is incorrect.

* Option D: By integrating diverse data sources through custom APIsSAP BDC integrates diverse data sources through prebuilt connectors, open data ecosystems, and partnerships (e.g., with Databricks), rather than relying primarily on custom APIs. While APIs may be used in some integration scenarios, the documentation does not highlight custom APIs as a key mechanism for facilitating AI-powered analytics. Instead, the platform's strength lies in its ability to seamlessly connect data sources via standardized integration frameworks and a unified semantic layer, making custom APIs a secondary or non-emphasized approach.Extract: "The partnership between SAP and Databricks enables customers to combine the benefits of SAP Business Data Cloud with Databricks' powerful AI and ML capabilities.
... SAP Business Data Cloud can now natively read data from and write data to Databricks, enabling customers to use the Databricks platform to build and deploy their own machine learning models and generative AI applications." This option is incorrect.
Summary of Correct answer:
* A: SAP BDC facilitates AI-powered analytics by centralizing SAP and non-SAP data into a unified semantic layer, which ensures trusted, context-rich data for AI and ML applications, enabling accurate and actionable insights.
