Three High in Demand Nutanix NCP-US-6.5 Exam Questions Formats

BTW, DOWNLOAD part of ITdumpsfree NCP-US-6.5 dumps from Cloud Storage: https://drive.google.com/open?id=1jsEReYk1SLOO6XEdxlItOQoJKn4Z6Vts

Allowing for your problems about passing the exam, our experts made all necessary points into our NCP-US-6.5 training materials, making it the most efficient way to achieve success. They can alleviate your pressure, relieve you of tremendous knowledge and master the key points with the least time. As customer-oriented company, we believe in satisfying the customers at any costs. Instead of focusing on profits, we determined to help every customer harvest desirable outcomes by our NCP-US-6.5 Training Materials. So our staff and after-sales sections are regularly interacting with customers for their further requirements and to know satisfaction levels of them.

Nutanix certification NCP-US-6.5 exam is a test of IT professional knowledge. ITdumpsfree is a website which can help you quickly pass Nutanix certification NCP-US-6.5 exams. In order to pass Nutanix certification NCP-US-6.5 exam, many people who attend Nutanix certification NCP-US-6.5 exam have spent a lot of time and effort, or spend a lot of money to participate in the cram school. ITdumpsfree is able to let you need to spend less time, money and effort to prepare for Nutanix Certification NCP-US-6.5 Exam, which will offer you a targeted training. You only need about 20 hours training to pass the exam successfully.

Quiz Efficient Nutanix - NCP-US-6.5 - Nutanix Certified Professional - Unified Storage (NCP-US) v6.5 Vce Torrent

Are you planning to attempt the Nutanix NCP-US-6.5 certification exam and don't know where to study for it and pass it with good

marks? ITdumpsfree has designed the Nutanix Certified Professional - Unified Storage (NCP-US) v6.5 (NCP-US-6.5) Questions, especially for the students who want to pass the NCP-US-6.5 Certification Exam with good marks in a short time. These Nutanix Certified Professional - Unified Storage (NCP-US) v6.5 (NCP-US-6.5) practice test questions are available in three different formats that you can carry with you anywhere and even do preparation in extra or free time with ease.

Nutanix NCP-US-6.5 Exam Syllabus Topics:

Topic	Details
Topic 1	• Deploy and Upgrade Nutanix Unified Storage • Perform upgrades • maintenance for Files • Objects implementations
Topic 2	• Configure Nutanix Objects • Describe how to monitor performance and usage
Topic 3	• Troubleshoot issues related to Nutanix Objects • Troubleshoot issues related to Nutanix Volumes
Topic 4	• Given a scenario, configure shares, buckets, and • or Volume Groups • Troubleshoot a failed upgrade for Files • Objects
Topic 5	• Configure and Utilize Nutanix Unified Storage • Identify the steps to deploy Nutanix Objects

Nutanix Certified Professional - Unified Storage (NCP-US) v6.5 Sample Questions (Q13-Q18):

NEW QUESTION # 13
Which Nutanix Unified Storage capability allows for monitoring usage for all Files deployment globally?

- A. Nutanix Cloud Manager
- B. Data Lens
- C. File Analytics
- D. Files Manager

Answer: B

Explanation:
Data Lens is a feature that provides insights into the data stored in Files across multiple sites, including different geographical locations. Data Lens allows administrators to monitor usage, performance, capacity, and growth trends for all Files deployments globally. Data Lens also provides reports on file types, sizes, owners, permissions, and access patterns3. Reference: Nutanix Data Lens Administration Guide3

NEW QUESTION # 14
An administrator has been requested to increase the maximum capacity of a share on a Files instance. How should the administrator perform this action in Files Console?

- A. Select the Settings tab, Click Rename.
- B. Select the Settings tab, Click Change.
- C. Select the Shares tab, Click Modify.
- D. Select the Shares tab, Click Update.

Answer: C

Explanation:
Nutanix Files, part of Nutanix Unified Storage (NUS), allows administrators to manage file shares through the Files Console, which is accessible via Prism Central. A share in Nutanix Files can have a maximum capacity (quota) defined to limit its storage usage. To increase this capacity, the administrator must modify the share's settings.
Analysis of Options:
* Option A (Select the Settings tab, Click Change): Incorrect. The Settings tab in the Files Console is used for general file server settings (e.g., AD integration, global configurations), not for modifying individual share properties like capacity.
* Option B (Select the Shares tab, Click Modify): Correct. To increase the maximum capacity of a share, the administrator should navigate to the Shares tab in the Files Console, select the share, and click Modify (or Edit, depending on the version). This opens a dialog where the share's quota (maximum capacity) can be adjusted.
* Option C (Select the Settings tab, Click Rename): Incorrect. Renaming a share under the Settings tab does not affect its capacity. The Settings tab is not the correct location for share-specific changes like capacity adjustments.
* Option D (Select the Shares tab, Click Update): Incorrect. While the Shares tab is the correct location, "Update" is not a standard action in the Files Console for modifying share properties. The correct action is "Modify" or "Edit," as in option B.
Why Option B?
The Shares tab in the Files Console is where administrators manage individual shares, including their properties like maximum capacity (quota). The Modify (or Edit) action allows the administrator to adjust the share's quota, increasing its maximum capacity as requested.
Exact Extract from Nutanix Documentation:
From the Nutanix Files Administration Guide (available on the Nutanix Portal):
"To modify the maximum capacity (quota) of a share, navigate to the Shares tab in the Files Console. Select the share you want to modify, and click Modify. In the dialog, adjust the quota settings to increase the maximum capacity as needed, then save the changes."
:
Nutanix Files Administration Guide, Version 4.0, Section: "Managing Shares in Files Console" (Nutanix Portal).
Nutanix Certified Professional - Unified Storage (NCP-US) Study Guide, Section: "Nutanix Files Share Management".

NEW QUESTION # 15
An administrator is able to review and modify objects in a registered ESXI cluster from a PE instance, but when the administrator attempts to deploy an Objects cluster to the same ESXi cluster, the error that is shown in the exhibit is shown.
What is the appropriate configuration to verify to allow successful Objects cluster deployment to this ESXi cluster?

- A. Replace the expired self-signed SSL certificate for the Object Store with a non-expired ' signed by a valid Certificate Authority.
- B. Ensure that vCenter in PE cluster is registered using FQDN and that vCenter details in Objects UI are using IP address.
- C. Replace the expired self-signed SSL certificate for the Object Store with a non-expired self signed SSL certificate.
- D. Ensure that vCenter in PE cluster is registered using FQDN and that vCenter details in Objects UI are using FQDN.

Answer: D

Explanation:
The appropriate configuration to verify to allow successful Objects cluster deployment to this ESXi cluster is to ensure that vCenter in PE cluster is registered using FQDN (Fully Qualified Domain Name) and that vCenter details in Objects UI are using FQDN. FQDN is a domain name that specifies the exact location of a host in the domain hierarchy. For example, esxi01.nutanix.com is an FQDN for an ESXi host. Using FQDN instead of IP addresses can avoid certificate validation errors when deploying Objects clusters to ESXi clusters. References: Nutanix Objects User Guide, page 9; Nutanix Objects Troubleshooting Guide, page 5

NEW QUESTION # 16
An organization currently has two Objects instances deployed between two sites. Both instances are managed via manage the same Prism Central to simplify management.
The organization has a critical application with all data in a bucket that needs to be replicated to the secondary site for DR purposes. The replication needs to be asynchronous, including al delete the marker versions.

- A. With Object Browser, upload the data at the destination site.
- B. Leverage the Objects Baseline Replication Tool from a Linus VM
- C. Use a protection Domain to replicate the objects Volume Group.
- D. Create a Bucket replication rule, set the destination Objects instances.

Answer: D

Explanation:

The administrator can achieve this requirement by creating a bucket replication rule and setting the destination Objects instance. Bucket replication is a feature that allows administrators to replicate data from one bucket to another bucket on a different Objects instance for disaster recovery or data migration purposes.

Bucket replication can be configured with various parameters, such as replication mode, replication frequency, replication status, etc. Bucket replication can also replicate all versions of objects, including delete markers, which are special versions that indicate that an object has been deleted. By creating a bucket replication rule and setting the destination Objects instance, the administrator can replicate data from one Objects instance to another asynchronously, including all delete markers and versions. References: Nutanix Objects User Guide, page 19; Nutanix Objects Solution Guide, page 9 Nutanix Objects, part of Nutanix Unified Storage (NUS), supports replication of buckets between Object Store instances for disaster recovery (DR). The organization has two Objects instances across two sites, managed by the same Prism Central, and needs to replicate a bucket's data asynchronously, including delete marker versions, to the secondary site.

Analysis of Options:

* Option A (With Object Browser, upload the data at the destination site): Incorrect. The Object Browser is a UI tool in Nutanix Objects for managing buckets and objects, but it is not designed for replication. Manually uploading data to the destination site does not satisfy the requirement for asynchronous replication, nor does it handle delete marker versions automatically.

* Option B (Leverage the Objects Baseline Replication Tool from a Linux VM): Incorrect. The Objects Baseline Replication Tool is not a standard feature in Nutanix Objects documentation. While third-party tools or scripts might be used for manual replication, Nutanix provides a native solution for bucket replication, making this option unnecessary and incorrect for satisfying the requirement.

* Option C (Use a Protection Domain to replicate the Objects Volume Group): Incorrect. Protection Domains are used in Nutanix for protecting VMs and Volume Groups (block storage) via replication, but they do not apply to Nutanix Objects. Objects uses bucket replication rules for DR, not Protection Domains.

* Option D (Create a Bucket replication rule, set the destination Objects instance): Correct. Nutanix Objects supports bucket replication rules to replicate data between Object Store instances asynchronously. This feature allows the organization to replicate the bucket to the secondary site, including all versions (such as delete marker versions), as required. The replication rule can be configured in Prism Central, specifying the destination Object Store instance, and it supports asynchronous replication for DR purposes.

Why Option D?

Bucket replication in Nutanix Objects is the native mechanism for asynchronous replication between Object Store instances. It supports replicating all versions of objects, including delete marker versions (which indicate deleted objects in a versioned bucket), ensuring that the secondary site has a complete replica of the bucket for DR. Since both Object Store instances are managed by the same Prism Central, the administrator can easily create a replication rule to meet the requirement.

Exact Extract from Nutanix Documentation:

From the Nutanix Objects Administration Guide (available on the Nutanix Portal):

"Nutanix Objects supports asynchronous bucket replication for disaster recovery. To replicate a bucket to a secondary site, create a bucket replication rule in Prism Central, specifying the destination Object Store instance. The replication rule can be configured to include all versions, including delete marker versions, ensuring that the secondary site maintains a complete replica of the bucket for DR purposes."

:

Nutanix Objects Administration Guide, Version 4.0, Section: "Bucket Replication for Disaster Recovery" (Nutanix Portal).

Nutanix Certified Professional - Unified Storage (NCP-US) Study Guide, Section: "Nutanix Objects Replication Features".

NEW QUESTION # 17

An administrator has received an alert AI303551 - VolumeGroupProtectionFailed details of alerts as follows:

Which error logs should the administrator be reviewing to determine why the relative service is down:

- A. solver.log
- B. arithmos.ERROR

Answer: B

Explanation:

The error log that the administrator should review to determine why the relative service is down is arithmos.

ERROR. Arithmos is a service that runs on each CVM and provides volume group protection functionality for Volumes. Volume group protection is a feature that allows administrators to create protection policies for volume groups, which define how often snapshots are taken, how long they are retained, and where they are replicated. If arithmos.ERROR log shows any errors or exceptions related to volume group protection, it can indicate that the relative service is down or not functioning properly.
