JN0-336 Valid Exam Objectives, JN0-336 Certification Exam Cost

Choose JN0-336 premium files, you will pass for sure. Each questions & answers of JN0-336 free training pdf are edited and summarized by our specialist with utmost care and professionalism. The Juniper JN0-336 latest online test is valid and really trustworthy for you to rely on. The highly relevant content & best valid and useful JN0-336 Exam Torrent will give you more confidence and help you pass easily.

Juniper Security, Specialist (JNCIS-SEC) Sample Questions (Q92-Q97):

NEW QUESTION # 92

Which two statements are true about Juniper ATP Cloud? (Choose two.)

- **A. Dynamic analysis is not always necessary to determine if a file contains malware.**
- B. Dynamic analysis is always performed to determine if a file contains malware.
- C. If the cache lookup determines that a file contains malware, performed to verify the results.
- **D. If the cache lookup determines that a file contains malware, static analysis is not performed to verify the results.**

Answer: A,D

Explanation:

Dynamic analysis is not always necessary to determine if a file contains malware, as the ATP Cloud uses a cache lookup to quickly identify known malicious files. If the cache lookup determines that a file contains malware, static analysis is not performed to verify the results. This information can be found on the Juniper website here: https://www.juniper.net/documentation/en_US/release-independent/security/jnpr-security-srx-series/inform

NEW QUESTION # 93

Which three statements about SRX Series device chassis clusters are true? (Choose three.)

- A. Heartbeat messages verify that the chassis cluster control link is working.
- B. A control link failure causes the secondary cluster node to be disabled.
- C. Recovery from a control link failure requires that the secondary member device be rebooted.
- D. Chassis cluster control links must be configured using RFC 1918 IP addresses.
- E. Chassis cluster member devices synchronize configuration using the control link.

Answer: A,B,E

Explanation:

B: Chassis cluster member devices synchronize configuration using the control link: This statement is correct because the control link is used for configuration synchronization among other functions.

C: A control link failure causes the secondary cluster node to be disabled: This statement is correct because a control link failure causes the secondary node to become ineligible for primary role and remain in secondary role until the control link is restored.

E: Heartbeat messages verify that the chassis cluster control link is working: This statement is correct because heartbeat messages are sent periodically over the control link to monitor its status.

NEW QUESTION # 94

While working on an SRX firewall, you execute the show security policies policy-name <name> detail command. Which function does this command accomplish?

- A. It shows the system log files for the local SRX Series device.
- B. It identifies the different custom policies enabled.
- C. It displays details about the default security policy.
- D. It shows policy counters for a configured policy.

Answer: D

Explanation:

The function that the show security policies policy-name <name> detail command accomplishes is showing policy counters for a configured policy. Policy counters are statistics that indicate how many times a policy has been matched by traffic and what actions have been taken by the policy. Policy counters can help you monitor and troubleshoot the performance and effectiveness of your security policies. The show security policies policy-name <name> detail command displays detailed information about a specific policy, such as its source zone, destination zone, description, state, hit count, byte count, packet count, action count, and session count.

Reference: = show security policies, show security policies information, [SRX] How to troubleshoot a security policy that is not passing data

NEW QUESTION # 95

You enable chassis clustering on two devices and assign a cluster ID and a node ID to each device. In this scenario, what is the correct order for rebooting the devices?

- A. Reboot only the primary device since the secondary will assign itself the correct cluster and node ID.
- B. Reboot the secondary device, then the primary device.
- C. Reboot only the secondary device since the primary will assign itself the correct cluster and node ID.
- D. Reboot the primary device, then the secondary device.

Answer: B

Explanation:

When chassis clustering is enabled and IDs are assigned, it is typically recommended to first reboot the secondary device. This allows the secondary device to fully integrate and recognize its role and settings within the cluster without affecting the ongoing traffic that the primary device might be handling.

Once the secondary device has successfully rebooted and is operational within the cluster, the primary device can then be rebooted. This ensures that the primary device's reboot does not cause any network downtime, as the secondary device, now fully operational, can take over the traffic and roles as needed.

NEW QUESTION # 96

Which two statements are correct about App Track? (Choose two.)

- A. App Track collects traffic flow information including byte, packet, and duration statistics.
- B. App Track can be configured for any defined logical system on an SRX Series device.
- C. App Track identifies and blocks traffic flows that might be malicious regardless of the ports being used.
- D. App Track can only be configured in the main logical system on an SRX Series device.

Answer: A,B

Explanation:

AppTrack is a feature that allows you to monitor and analyze the application traffic on your SRX Series device. It can be configured for any defined logical system, which is a virtual router or switch within a physical device. AppTrack collects statistics such as bytes, packets, and duration for each application flow and displays them in reports or logs. AppTrack does not identify or block malicious traffic, that is the function of AppSecure or IDP/IPS.
