In this high-speed world, a waste of time is equal to a waste of money. As an electronic product, our 312-50v13 real study dumps have the distinct advantage of fast delivery. On one hand, we adopt a reasonable price for you, ensures people whoever is rich or poor would have the equal access to buy our useful 312-50v13 real study dumps. On the other hand, we provide you the responsible 24/7 service. Our candidates might meet so problems during purchasing and using our 312-50v13 Prep Guide, you can contact with us through the email, and we will give you respond and solution as quick as possible. With the commitment of helping candidates to pass 312-50v13 exam, we have won wide approvals by our clients. We always take our candidates' benefits as the priority, so you can trust us without any hesitation.

312-50v13 Exam Dumps add vivid examples and accurate charts to stimulate those exceptional cases you may be confronted with. 312-50v13 Guide Torrent has been known as one of the world's leading providers of exam materials. 312-50v13 Test Questions free updating for one year and half price for further partnerships.

Pass Guaranteed 2025 Accurate 312-50v13: Minimum Certified Ethical Hacker Exam (CEHv13) Pass Score

Our 312-50v13 study materials are very popular in the international market and enjoy wide praise by the people in and outside the circle. We have shaped our 312-50v13 exam questions into a famous and top-ranking brand and we enjoy well-deserved reputation among the clients. Our 312-50v13 study materials boost many outstanding and superior advantages which other same kinds of products don't have. The clients can try out and download our study materials before their purchase. They can immediately use our 312-50v13 training guide after they pay successfully.

ECCouncil Certified Ethical Hacker Exam (CEHv13) Sample Questions (Q267-Q272):

NEW QUESTION # 267

As a cybersecurity analyst for SecureNet, you are performing a security assessment of a new mobile payment application. One of your primary concerns is the secure storage of customer data on the device. The application stores sensitive information such as

credit card details and personal identification numbers (PINs) on the device. Which of the following measures would best ensure the security of this data?

- A. Enable GPS tracking for all devices using the app.
- **B. Encrypt all sensitive data stored on the device.**
- C. Implement biometric authentication for app access.
- D. Regularly update the app to the latest version.

Answer: B

Explanation:

Encrypting all sensitive data stored on the device is the best measure to ensure the security of this data, because it protects the data from unauthorized access or disclosure, even if the device is lost, stolen, or compromised. Encryption is a process of transforming data into an unreadable format using a secret key or algorithm. Only authorized parties who have the correct key or algorithm can decrypt and access the data.

Encryption can be applied to data at rest, such as files or databases, or data in transit, such as network traffic or messages.

Encryption can prevent attackers from stealing or tampering with the customer data stored on the device, such as credit card details and PINs, which can cause financial or identity fraud.

The other options are not as effective or sufficient as encryption for securing the customer data stored on the device. Implementing biometric authentication for app access may provide an additional layer of security, but it does not protect the data from being accessed by other means, such as malware, physical access, or backup extraction. Enabling GPS tracking for all devices using the app may help locate the device in case of loss or theft, but it does not prevent the data from being accessed by unauthorized parties, and it may also pose privacy risks. Regularly updating the app to the latest version may help fix bugs or vulnerabilities, but it does not guarantee the security of the data, especially if the app does not use encryption or other security features. NEW QUESTION # 268

You are a security officer of a company. You had an alert from IDS that indicates that one PC on your Intranet is connected to a blacklisted IP address (C2 Server) on the Internet. The IP address was blacklisted just before the alert. You are starting an investigation to roughly analyze the severity of the situation. Which of the following is appropriate to analyze?

- A. IDS log
- B. Event logs on the PC
- **C. Internet Firewall/Proxy log**
- D. Event logs on domain controller

Answer: C

Explanation:

In CEH v13 Module 04: Enumeration and Module 06: Malware Threats, when investigating Command-and- Control (C2) communication, it is important to determine whether the communication actually occurred and what data was sent.

C). Internet Firewall/Proxy log

Best source to confirm outbound connections to external IPs.

Proxy logs show which internal host made the connection, the timestamp, and sometimes even URL and payload.

Firewalls can indicate port usage, traffic volume, and connection duration.

This data gives a direct view of how severe the incident is, whether data exfiltration occurred, and which internal system is affected.

Why Other Options Are Less Effective Initially:

A). IDS Log: Only tells you that an alert was generated. May be false positive or triggered by a failed connection.

B). Event logs on Domain Controller: Useful for user account behavior, but not for network connections.

D). Event logs on the PC: May lack detail or be tampered with by malware.

NEW QUESTION # 269

What is a NULL scan?

- A. A scan with an illegal packet size
- B. A scan in which all flags are on
- **C. A scan in which all flags are turned off**
- D. A scan in which certain flags are off
- E. A scan in which the packet size is set to zero

Answer: C

Explanation:

A NULL scan is a type of TCP scan where no TCP flags are set in the packet. This unconventional packet is used to evade firewalls and intrusion detection systems and to determine the state of a port based on the response.

Behavior:

* Open port # No response

* Closed port # RST (Reset)

From CEH v13 Courseware:

* Module 3: Scanning Networks

* Topic: TCP Flag Scanning Methods

CEH v13 Study Guide states:

"A NULL scan sends a TCP packet with all flags turned off. The system's response (or lack thereof) allows the attacker to infer whether a port is open or closed, especially on UNIX-based systems." Incorrect Options:

* B: Vague and inaccurate

* C: Refers to Xmas scan (URG, PSH, FIN)

* D/E: Irrelevant to TCP flags

Reference:CEH v13 Study Guide - Module 3: Scanning Networks # TCP NULL ScansRFC 793 - TCP Protocol Behavior

NEW QUESTION # 270

During an Xmas scan what indicates a port is closed?

- A. SYN
- **B. RST**
- C. ACK
- D. No return response

Answer: B

NEW QUESTION # 271

In your cybersecurity class, you are learning about common security risks associated with web servers. One topic that comes up is the risk posed by using default server settings. Why is using default settings on a web - server considered a security risk, and what would be the best initial step to mitigate this risk?

- **A. Default settings reveal server software type; change these settings**
- B. Default settings cause server malfunctions; simplify the settings
- C. Default settings allow unlimited login attempts; setup account lockout
- D. Default settings enable auto-updates; disable and manually patch

Answer: A

Explanation:

Using default settings on a web server is considered a security risk because it can reveal the server software type and version, which can help attackers identify potential vulnerabilities and launch targeted attacks. For example, if the default settings include a server signature that displays the name and version of the web server software, such as Apache 2.4.46, an attacker can search for known exploits or bugs that affect that specific software and version. Additionally, default settings may also include other insecure configurations, such as weak passwords, unnecessary services, or open ports, that can expose the web server to unauthorized access or compromise.

The best initial step to mitigate this risk is to change the default settings to hide or obscure the server software type and version, as well as to disable or remove any unnecessary or insecure features. For example, to hide the server signature, one can modify the ServerTokens and ServerSignature directives in the Apache configuration file¹. Alternatively, one can use a web application firewall or a reverse proxy to mask the server information from the client requests². Changing the default settings can reduce the attack surface and make it harder for attackers to exploit the web server.
