100% Pass Reliable Ping Identity - PAP-001 - Valid Certified Professional - PingAccess Exam Format

A few crops of practice materials are emerging in the market these days, with undecided quality to judge from customers' perspective. If you choose the wrong PAP-001 practice material, it will be a grave mistake. Their behavior has not been strictly ethical and irresponsible to you, which we will never do. We know making progress and getting the certificate of PAP-001 Training Materials will be a matter of course with the most professional experts in command of the newest and the most accurate knowledge in it. That's why our Certified Professional - PingAccess exam prep has taken up a large part of market.

Ping Identity Certified Professional - PingAccess Sample Questions (Q28-Q33):

NEW QUESTION # 28

All access requests to the existing/adminresource must be captured in the audit log. How should this be accomplished?

- A. Set Splunk audit logging for/admin
- **B. Enable the Audit option for the/adminresource**
- C. Enable the Audit option for the/*resource
- D. Setlog4j2.xmlaudit logging for/admin

Answer: B

Explanation:

PingAccess resources have anAudit flag. When enabled, all access attempts (allowed or denied) are recorded in the audit logs.

Exact Extract:

"To audit access requests to a specific resource, enable the Audit option on that resource in the application configuration."

* Option A is correct - enabling audit for/adminensures its access requests are logged.

* Option B is incorrect - enabling audit for/*is overly broad and logs everything, not just/admin.

* Option C is incorrect - Splunk integration is for log forwarding, not per-resource auditing.

* Option D is incorrect -log4j2.xmlcontrols log destinations/levels, not resource-specific auditing.

Reference:PingAccess Administration Guide -Resource Audit Logging

NEW QUESTION # 29

A PingAccess API deployment requires multiple Access Token Managers to maintain compliance with customer requirements. Which feature must be set on the Token Provider configuration?

- A. Client Secret
- B. Use Token Introspection Endpoint
- **C. Send Audience**
- D. Subject Attribute Name

Answer: C

Explanation:

When using multiple Access Token Managers, theSend Audienceoption ensures that tokens are scoped properly and validated against the intended resource/application.

Exact Extract:

"EnableSend Audiencein the token provider configuration to support environments with multiple Access Token Managers and enforce correct audience restrictions."

* Option A (Subject Attribute Name)is unrelated - it maps user identity but not token manager selection.

* Option B (Send Audience)is correct - required when multiple ATMs are in use.

* Option C (Use Token Introspection Endpoint)is optional and depends on deployment, not mandatory for multiple ATMs.

* Option D (Client Secret)is part ofOAuth client credentials, not specific to multiple ATMs.

NEW QUESTION # 30

During a business review of an application, the administrator needs to change the Resource Authentication to anonymous. What are the two effects of making this change to the resource? (Choose 2 answers.)

- A. The resource requires no further authentication, and all Access Control rules still apply.
- B. Requests to this resource are not logged, and Identity Mappings are applied.
- **C. The resource requires no further authentication, and Processing rules still apply.**
- D. The resource requires no further authentication, and no rules will apply.
- **E. The resource requires no further authentication, and Identity Mappings still apply.**

Answer: C,E

Explanation:

When a resource is configured asanonymous, PingAccess does not challenge the user for authentication.

However, certain processing and identity propagation still occur.

Exact Extract:

"Anonymous resources do not require authentication. Identity mappings and request/response processing rules still apply."

- * Option A is incorrect because rules such as identity mappings and processing still apply.
- * Option B is correct - Identity Mappings can still forward attributes, even for anonymous access.
- * Option C is correct - Processing rules (e.g., request/response modifications) still apply.
- * Option D is incorrect - requests are logged; anonymous does not disable logging.
- * Option E is incorrect - access control rules (authorization) are not evaluated for anonymous resources.

NEW QUESTION # 31

A company has removed the requirement to record back-channel requests from PingAccess to PingFederate in the audit log. Where should the administrator update this behavior without affecting existing applications?

- **A. Token Validation**
- B. Web Sessions
- C. Token Provider
- D. Sites

Answer: A

Explanation:

PingAccess can be configured to log or suppress back-channel requests that occur during token validation with an OAuth/OpenID Connect provider such as PingFederate. These requests happen when PingAccess calls PingFederate to validate access tokens or retrieve key material.

* Exact Extract from PingAccess documentation:

"Back-channel requests are logged during token validation by default. To prevent these requests from being written to the audit log, update the Token Validation settings in PingAccess." This makes Token Validation the correct location for changing the behavior without modifying application-specific configurations.

Why other options are wrong:

- * B. Web Sessions
Incorrect. Web Sessions control user session management and cookie handling, not back-channel token validation traffic.
- * C. Sites
Incorrect. Sites are the definitions of backend servers that PingAccess proxies to. This setting does not affect back-channel logging to PingFederate.
- * D. Token Provider
Incorrect. The Token Provider defines the OIDC/OAuth server (e.g., PingFederate) and its endpoints, but the logging of back-channel requests is not controlled here.

Thus, the correct answer is A. Token Validation.

NEW QUESTION # 32

An administrator configures the following:

- * HTTP Request Parameter Rule for "can_read=yes"
- * Web Session Attribute Rule for Opt-in = yes
- * Web Session Attribute Rule for group = customerService
- * Rule Set A (ALL) # includes (HTTP Request Parameter Rule)
- * Rule Set B (ANY) # includes (Opt-in yes, group customerService)
- * Rule Set Group C (ALL) # includes (Rule Set A, Rule Set B) Assigned to the web application.

Which set of conditions must be met to be able to access the application?

- A. The request requires a parameter called can_read with a value of yes unless the authenticated user is in either customer service or has the opt-in attribute set to yes.
- **B. The request requires a parameter called can_read with a value of yes. The authenticated user must be either in customer service or have the opt-in attribute set to yes.**
- C. The request requires a parameter called can_read with a value of yes. Additionally, the authenticated user must be in customer service and have the opt-in attribute set to yes.
- D. The request requires a parameter called can_read with a value of yes unless the authenticated user is in customer service and the opt-in attribute set to yes.

Answer: B

Explanation:

The Rule Set Group C (ALL) requires both Rule Set A and Rule Set B to evaluate to true.

* Rule Set A (ALL) requires can_read=yes.

* Rule Set B (ANY) requires either opt-in=yes OR group=customerService.

* Together in Rule Set Group C (ALL), both conditions must hold:

* can_read=yes must be present in the request.

* User must have either opt-in=yes or be in the customerService group.

This matches Option D exactly.

* Option A is incorrect; it requires both attributes in Rule Set B, but B is ANY (either is sufficient).

* Option B is incorrect; the "unless" wording is misleading - the parameter is always required because Rule Set A uses ALL.

* Option C is incorrect; same reasoning as above, B is ANY not AND.

* Option D is correct - can_read=yes AND (opt-in=yes OR group=customerService).
