### **Salesforce Certified MuleSoft Integration Foundations Sample Questions (Q25-Q30):**

#### **NEW QUESTION # 25**

According to MuleSoft's recommended REST conventions, which HTTP method should an API use to specify how API clients can request data from a specified resource?

- **A. GET**
- B. POST
- C. PATCH
- D. PUT

**Answer: A**

Explanation:

HTTP GET: The GET method is used to retrieve (read) a representation of a resource<sup>4</sup>. It is safe and idempotent, meaning it does not alter the state of the server.

Usage: If you want to "request data" (e.g., Get Customer Details), GET is the standard method.

Why others are incorrect:

POST: Used to create a new resource.

PUT: Used to replace (update) an entire resource.

PATCH: Used to partially update a resource.

#### **NEW QUESTION # 26**

According to the Internet Engineering Task Force (IETF), which supporting protocol does File Transfer Protocol (FTP) use for reliable communication?

- A. Secure Sockets Layer (SSL)
- B. Lightweight Directory Access Protocol (LDAP)
- C. Hypertext Transfer Protocol (HTTP)
- **D. Transmission Control Protocol (TCP)**

**Answer: D**

Explanation:

TCP (Transmission Control Protocol): FTP is an application-layer protocol that relies on TCP at the transport layer to ensure reliable, ordered, and error-checked delivery of a stream of bytes<sup>12</sup>.

Mechanism: FTP establishes two TCP connections: one for control (commands) and one for data transfer.

Why others are incorrect:

UDP: Is unreliable (best effort).

HTTP: Is an alternative application protocol, not the transport layer for FTP.

LDAP: Is for directories.

### NEW QUESTION # 27

According to MuleSoft, which principle is common to both Service Oriented Architecture (SOA) and API-led connectivity approaches? 11

- A. Service reusability
- B. Service centralization
- C. Service statefulness
- D. Service interdependence

**Answer: A**

Explanation:

Comprehensive and Detailed Explanation:

The Shared Goal: Both SOA (an older architectural style) and API-led Connectivity (MuleSoft's modern approach) aim to solve the problem of "Spaghetti Code" by breaking monolithic applications into smaller pieces.

Reusability: The core promise of both is Reusability.

SOA: Aimed to create reusable web services (often SOAP).

API-led: Focuses on creating reusable Assets (System, Process, and Experience APIs) that can be discovered and self-served by other teams.

The Difference: While the goal (Reuse) is the same, SOA often failed due to heavy governance and lack of discoverability. API-led connectivity improves on this by emphasizing consumption and self-service via the Anypoint Exchange.

### NEW QUESTION # 28

Which key DevOps practice and associated Anypoint Platform component should a MuleSoft Integration team adopt to improve delivery quality?

- A. Manual testing with Anypoint Studio
- B. Continuous design with API Designer
- C. Automated testing with MUnit
- D. Passive monitoring with Anypoint Monitoring

**Answer: C**

Explanation:

DevOps & Quality: A core tenet of DevOps is CI/CD (Continuous Integration/Continuous Delivery). To achieve high quality in a fast-paced CI/CD pipeline, testing must be automated, not manual.

MUnit: This is the native testing framework for Mule applications. It allows developers to write unit and integration tests that run automatically during the build process (e.g., via Maven).<sup>12</sup> Why others are incorrect:<sup>34</sup> Manual testing (B): Is slow, error-prone, and not a "DevOps" scaling practice.<sup>56</sup> Passive monitoring (A): happens after deployment (Operations), whereas MUnit ensures quality<sup>7</sup> during development/build.

### NEW QUESTION # 29

During a planning session with the executive leadership, the development team director presents plans for a new API to expose the data in the company's order database. An earlier effort to build an API on top of this data failed, so the director is recommending a design-first approach.

- A. Publishing the fully implemented API to Exchange so all developers can reuse the API
- B. Building MUnit tests so administrators can confirm code coverage percentage during deployment
- C. Adding global policies to the API so all developers automatically secure the implementation before coding anything
- D. Developing a specification so consumers can test before the implementation is built

**Answer: D**

Explanation:

Design-First Approach: This methodology prioritizes creating the API contract (RAML/OAS) before writing any code<sup>19</sup>.

The Benefit: By defining the specification first and publishing it to Exchange (often with a Mocking Service), API consumers (frontend developers or other teams) can test and provide feedback on the design immediately.<sup>20</sup> This ensures the API meets business needs before the expensive work of backend implementation begins, preventing the failure described in the

scenario2122.23 Why others are incorrect:

Publishing fully implemented API (C): This is a "Code-First" approach (build first, share later).

Global Policies (B): Relates to governance, not the design methodology.
