CPHIMS試験の準備方法 | 効率的なCPHIMS日本語版対応参考書試験 | 最高のHIMSS Certified Professional in Healthcare Information and Management Systems関連問題資料

JpshikenのCPHIMS問題集は素晴らしい参考資料です。この問題集は絶対あなたがずっと探しているものです。これは受験生の皆さんのために特別に作成し出された試験参考書です。この参考書は短い時間で試験に十分に準備させ、そして楽に試験に合格させます。試験のためにあまりの時間と精力を無駄にしたいくないなら、JpshikenのCPHIMS問題集は間違いなくあなたに最もふさわしい選択です。この資料を使用すると、あなたの学習効率を向上させ、多くの時間を節約することができます。

HIMSS Certified Professional in Healthcare Information and Management Systems 認定 CPHIMS 試験問題 (Q97-Q102):

質問 #97

Which of the following is the best example of a task that falls within the scope of responsibility of a Chief Nursing Informatics Officer?

- A. Financial impact of a new dialysis unit for a local hospital.
- B. Nursing workload and staffing in the Intensive Care Unit.
- C. Order set configuration to reduce medication errors in the EHR.
- D. Incident reports filed as a result of patient safety issues.

正解: C

解説:

A Chief Nursing Informatics Officer (CNIO) leads the strategic and operational alignment of nursing practice with health information technology, with a strong focus on optimizing the EHR to improve care quality, safety, and nursing workflow. Order set configuration to reduce medication errors is a clear informatics responsibility because it involves translating clinical best practices into standardized, usable EHR tools—such as evidence-based order sets, nursing protocols, documentation prompts, and safety checks—that reduce variation and prevent errors. A CNIO commonly partners with pharmacy, physician informatics, and IT analysts to ensure workflows support safe medication administration (e.g., standardized orders, consistent defaults, required fields, guardrails, and integration with eMAR/BCMA processes).

The other options are less directly within CNIO scope. Assessing the financial impact of a dialysis unit is typically a finance/operations function. Managing incident reports is usually led by risk management and patient safety departments (though informatics may support reporting systems). Nursing workload and staffing decisions are generally nursing operations/leadership responsibilities, even though informatics data can inform them. Therefore, the most appropriate CNIO task is EHR configuration work aimed at improving nursing-related patient safety outcomes, as described in option A.

質問 # 98

Which of the following defines a vision statement?

- A. Providing affordable, quality healthcare services and improving the health of our members and the communities we serve.
- **B. Striving to be the world's leader in patient experience, clinical outcomes, research, and education.**
- C. Extending compassionate, patient-centered care of the highest quality.
- D. Allowing for exceptional healthcare with compassion.

正解: B

解説:

A vision statement describes the organization's desired future state -what it aspires to become over the long term. It is forward-looking, inspirational, and aspirational. Option D ("Striving to be the world's leader in patient experience, clinical outcomes, research, and education.") clearly reflects this concept because it defines a future position of leadership and excellence. It communicates ambition, direction, and long-term achievement rather than current services or operational activities.

In contrast, options A, B, and C resemble mission statements, which focus on the organization's present purpose—what it does, whom it serves, and how it delivers value. For example, providing affordable healthcare or extending compassionate care describes current commitments and core services. Mission statements are operational and action-oriented, whereas vision statements describe the destination the organization seeks to reach.

From a healthcare management and leadership perspective, a clear vision aligns stakeholders, motivates employees, guides strategic planning, and supports digital transformation initiatives. Leadership frameworks in healthcare emphasize that vision provides the foundation for setting strategic goals, performance targets, and innovation priorities. Therefore, the statement that best defines a vision is option D because it articulates a compelling and aspirational future state.

質問 # 99

A project manager in a healthcare organization has been asked by the project team to solicit involvement of a physician in the next phase of a clinical systems implementation. Which of the following is the first step for the project manager to accomplish this?

- **A. Ask the Chief Medical Officer for candidate recommendations.**
- B. Develop an incentive to attract candidates.
- C. Send an email throughout the organization to recruit volunteers.
- D. Request volunteers at the next medical staff meeting.

正解: A

解説:

The first step should be to ask the Chief Medical Officer (CMO) for candidate recommendations because physician participation in clinical systems implementation is most effective when it is leadership-supported, appropriately vetted, and aligned with medical staff governance. The CMO (or equivalent physician executive leadership) understands physician leadership structures, department dynamics, credibility considerations, and who has the influence, availability, and interest to serve as a physician champion, subject matter expert, or governance representative. This approach also reinforces shared accountability: clinical transformation is not "an IT project," and engaging physician leadership early helps secure buy-in, clarify expectations for time commitment, and ensure representation reflects organizational priorities and patient safety needs.

The other options are less effective as a first action. A mass email (A) may produce volunteers, but not necessarily the right physician leader or specialty representation, and it can bypass medical staff leadership norms. Requesting volunteers at a medical staff meeting (C) is public and time-bound, and still may not yield a suitable, supported candidate. Developing incentives (B) may be helpful later for protected time or compensation, but selecting the right physician partner and sponsorship structure comes first. Therefore, engaging the CMO for recommendations is the best initial step.

質問 # 100

Strategic plans include

- A. financial projections.
- B. policies and procedures.
- C. budget requests.
- D. operational plans.

正解: D

解説:

A strategic plan defines an organization's long-term direction, priorities, and high-level goals, typically over a multi-year horizon. While it articulates mission alignment, competitive positioning, and major initiatives, it must also be translated into actionable steps. For this reason, strategic plans include or are supported by operational plans, which outline how the strategy will be executed in practice. Operational plans define timelines, responsibilities, resource allocation, performance metrics, and specific initiatives that move the organization toward its strategic objectives. In healthcare leadership and information systems governance, operational planning ensures that broad goals—such as digital transformation, quality improvement, or cost reduction—are implemented through concrete projects and workflows.

In contrast, budget requests and financial projections may support strategic planning but are financial management tools rather than core structural components of the strategic plan itself. Policies and procedures are detailed governance documents that guide daily operations; they support compliance and consistency but are not defining elements of a strategic plan.

Thus, operational plans are the key component that connects high-level strategy to day-to-day execution, making option A the correct answer.

質問 # 101

Which of the following systems supports all five rights of medication administration?

- A. BCMA.
- B. MAR.
- C. CPOE.
- D. DSS.

正解: A

解説:

Bar coded medication administration (BCMA) is the system specifically designed to support the "five rights" of medication administration—right patient, right drug, right dose, right route, and right time—by adding point-of-care barcode scanning and electronic verification within the medication-use workflow. In practice, BCMA requires the clinician to scan identifiers (commonly the patient wristband and the medication barcode). The clinical system then cross-checks the scanned medication against the active medication order and administration schedule, helping to prevent wrong-patient, wrong-drug, wrong-dose, wrong-route, and wrong-time errors before the medication is actually given. This direct bedside validation is what makes BCMA uniquely aligned with the five rights.

By comparison, CPOE primarily improves safety earlier in the process (ordering/prescribing) through legibility, standardization, and decision support, but it does not by itself verify the medication at bedside administration. A MAR/eMAR documents what is scheduled and what was administered; it supports documentation and scheduling but does not inherently enforce barcode-based identity and medication matching. A DSS can provide alerts and guidance, yet it is not a dedicated administration verification mechanism. Therefore, BCMA is the best answer because it directly operationalizes the five rights during medication administration.
