SOA-C02資格専門知識、SOA-C02試験解答

私たちの努力は自分の人生に更なる可能性を増加するためのことであると思われれます。あなたは弊社CertJukenのAmazon SOA-C02試験問題集を利用し、試験に一回合格しました。Amazon SOA-C02試験認定証明書を持つ皆様は面接のとき、他の面接人員よりもっと多くのチャンスがあります。その他、SOA-C02試験認定証明書も仕事昇進にたくさんのメリットを与えられます。

Amazon AWS Certified SysOps Administrator - Associate (SOA-C02) 認定 SOA-C02 試験問題 (Q724-Q729):

質問 # 724

A company needs to deploy a new workload on AWS. The company must encrypt all data at rest and must rotate the encryption

keys once each year. The workload uses an Amazon RDS for MySQL Multi-AZ database for data storage. Which configuration approach will meet these requirements?

- A. Create a new AWS Key Management Service (AWS KMS) customer managed key. Enable automatic key rotation. Enable encryption on the Amazon Elastic Block Store (Amazon EBS) volumes that are attached to the RDS DB instance.
- B. Enable Transparent Data Encryption (TDE) in the MySQL configuration file. Manually rotate the key every 12 months.
- C. Enable RDS encryption on the database at creation time by using the AWS managed key for Amazon RDS.
- **D. Create a new AWS Key Management Service (AWS KMS) customer managed key. Enable automatic key rotation. Enable RDS encryption on the database at creation time by using the KMS key.**

正解: D

質問 # 725

A company needs to monitor the disk utilization of Amazon Elastic Block Store (Amazon EBS) volumes. The EBS volumes are attached to Amazon EC2 Linux Instances. A SysOps administrator must set up an Amazon CloudWatch alarm that provides an alert when disk utilization increases to more than 80%.

Which combination of steps must the SysOps administrator take to meet these requirements? (Select THREE.)

- **A. Configure a CloudWatch alarm to enter ALARM state when the disk_used_percent CloudWatch metric is greater than 80%.**
- **B. Install and start the CloudWatch agent by using AWS Systems Manager or the command line**
- **C. Create an IAM role that includes the CloudWatchAgentServerPolicy AWS managed policy. Attach the role to the instances**
- D. Configure a CloudWatch alarm to enter ALARM state when the disk_used CloudWatch metric is greater than 80% or when the disk_free CloudWatch metric is less than 20%.
- E. Create an IAM role that includes the CloudWatchApplicationInsightsReadOnlyAccess AWS managed policy. Attach the role to the instances
- F. Install and start the CloudWatch agent by using an IAM role. Attach the CloudWatchAgentServerPolicy AWS managed policy to the role.

正解: A、B、C

解説:

* Create an IAM role with the CloudWatchAgentServerPolicy:

This policy grants the necessary permissions for the CloudWatch agent to collect and send metrics.

Steps:

Go to the AWS Management Console.

Navigate to IAM and create a new role.

Choose "EC2" as the trusted entity.

Attach the "CloudWatchAgentServerPolicy" managed policy to the role.

Attach this IAM role to your EC2 instances.

Reference:

* Install and start the CloudWatch agent:

The CloudWatch agent must be installed and configured to collect disk utilization metrics.

Steps:

Use AWS Systems Manager or SSH to connect to your instances.

Install the CloudWatch agent using the following commands:

```
sudo yum install amazon-cloudwatch-agent
```

```
sudo /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-config-wizard sudo /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl -a fetch-config -m ec2 -c file:/path/to/your-config-file.json -s
```

```
Start the agent: sudo systemctl start amazon-cloudwatch-agent
```

Configure a CloudWatch alarm:

Create an alarm based on the disk_used_percent metric.

Steps:

Go to the AWS Management Console.

Navigate to CloudWatch and select "Alarms" from the left-hand menu.

Click on "Create alarm."

Select the `disk_used_percent` metric.

Set the threshold to 80% and configure the alarm actions (e.g., sending a notification).

質問 # 726

A company is preparing for a marketing campaign that will increase traffic to a new web application. The application uses Amazon API Gateway and AWS Lambda for the application logic. The application stores relevant user data in an Amazon Aurora MySQL DB cluster that has one Aurora Replica.

Database queries for the application are 5% write and 95% read.

What should a SysOps administrator do to scale the database when traffic increases?

- A. Configure AWS Auto Scaling to monitor the Aurora cluster. Configure AWS Auto Scaling to add or remove Aurora Replicas in the cluster based on the average CPU utilization of the existing Aurora Replica.
- **B. Configure AWS Auto Scaling to monitor the Aurora cluster. Configure AWS Auto Scaling to add or remove Aurora Replicas in the cluster based on the average CPU utilization of the primary instance.**
- C. Configure Aurora Auto Scaling to increase or decrease the size of the Aurora Replicas based on the average CPU utilization of the Aurora Replicas.
- D. Configure Aurora Auto Scaling to add or remove Aurora Replicas in the cluster based on the average CPU utilization of the Aurora Replicas.

正解: B

質問 # 727

A custom application must be installed on all Amazon EC2 instances. The application is small, updated frequently, and can be installed automatically.

How can the application be deployed on new EC2 instances?

- A. Configure AWS CodePipeline to deploy code changes and updates.
- B. Use AWS Systems Manager to inject the application into an AMI.
- **C. Launch a script that downloads and installs the application using Amazon EC2 user data.**
- D. Create a custom API using Amazon API Gateway to call an installation executable from an AWS CloudFormation template.

正解: C

解説:

User data allows you to run scripts or execute commands on an EC2 instance during launch. You can include the script that downloads and installs the application in the user data section when launching an EC2 instance. This allows the application to be automatically deployed when the instance is launched.

質問 # 728

A company runs workloads on 90 Amazon EC2 instances in the eu-west-1 Region in an AWS account. In 2 months, the company will migrate the workloads from eu-west-1 to the eu-west-3 Region.

The company needs to reduce the cost of the EC2 instances. The company is willing to make a 1-year commitment that will begin next week. The company must choose an EC2 Instance purchasing option that will provide discounts for the 90 EC2 Instances regardless of Region during the 1-year period.

Which solution will meet these requirements?

- A. Purchase an EC2 Instance Savings Plan.
- B. Purchase EC2 Convertible Reserved Instances.
- C. Purchase EC2 Standard Reserved Instances.
- **D. Purchase a Compute Savings Plan.**

正解: D

解説:

To reduce the cost of EC2 instances with a 1-year commitment across different regions, purchasing a Compute Savings Plan is the most suitable option.

* Compute Savings Plan:

- * Compute Savings Plans provide the most flexibility and help to reduce your costs by up to 66%, offering savings on a variety of EC2 instance usage.
 - * These plans apply to usage across any AWS Region, and they also apply to AWS Lambda and AWS Fargate usage.
 - * Flexibility Across Regions:
 - * Unlike Reserved Instances, which are tied to a specific instance family and region, Compute Savings Plans provide savings across any EC2 instance usage, regardless of region, instance family, operating system, or tenancy.
 - * This flexibility is ideal for the company's requirement to migrate workloads from the eu-west-1 region to the eu-west-3 region within the commitment period.
 - * Implementation:
 - * Open the AWS Cost Management console.
 - * Navigate to the "Savings Plans" section.
 - * Purchase a Compute Savings Plan with a 1-year term.
- AWS Savings Plans
Compute Savings Plans

質問 # 729
