Amazon SAA-C03 (Amazon AWS Certified Solutions Architect - Associate) exam is a certification exam designed to test the skills and knowledge of individuals who want to become an AWS Certified Solutions Architect. SAA-C03 exam is intended for individuals who have experience designing distributed systems on the AWS platform and have a deep understanding of AWS services and their integration with one another. Successful completion of SAA-C03 Exam demonstrates that a candidate has a deep understanding of AWS services and can design scalable, reliable, and cost-efficient solutions.

## Amazon AWS Certified Solutions Architect - Associate Sample Questions (Q459-Q464):

### NEW QUESTION # 459

A security team wants to limit access to specific services or actions in all of the team's AWS accounts. All accounts belong to a large organization in AWS Organizations. The solution must be scalable and there must be a single point where permissions can be maintained.

What should a solutions architect do to accomplish this?

- A. Create a security group to allow accounts and attach it to user groups.
- B. Create an ACL to provide access to the services or actions.
- C. Create cross-account roles in each account to deny access to the services or actions.
- D. Create a service control policy in the root organizational unit to deny access to the services or actions.

### Answer: D

Explanation:

Service control policies (SCPs) are one type of policy that you can use to manage your organization. SCPs offer central control over the maximum available permissions for all accounts in your organization, allowing you to ensure your accounts stay within your organization's access control guidelines. See [https://docs.aws.amazon.com/organizations/latest/userguide/orgs\\_manage\\_policies\\_scp.html](https://docs.aws.amazon.com/organizations/latest/userguide/orgs_manage_policies_scp.html).

### NEW QUESTION # 460

A solutions architect is using Amazon S3 to design the storage architecture of a new digital media application.

The media files must be resilient to the loss of an Availability Zone. Some files are accessed frequently while other files are rarely accessed in an unpredictable pattern. The solutions architect must minimize the costs of storing and retrieving the media files.

Which storage option meets these requirements?

- A. S3 Standard-Infrequent Access (S3 Standard-IA)
- B. S3 Intelligent-Tiering
- C. S3 One Zone-Infrequent Access (S3 One Zone-IA)
- D. S3 Standard

### Answer: B

Explanation:

Explanation

S3 Intelligent-Tiering - Perfect use case when you don't know the frequency of access or irregular patterns of usage.

Amazon S3 offers a range of storage classes designed for different use cases. These include S3 Standard for general-purpose storage of frequently accessed data; S3 Intelligent-Tiering for data with unknown or changing access patterns; S3 Standard-Infrequent Access (S3 Standard-IA) and S3 One Zone-Infrequent Access (S3 One Zone-IA) for long-lived, but less frequently accessed data; and Amazon S3 Glacier (S3 Glacier) and Amazon S3 Glacier Deep Archive (S3 Glacier Deep Archive) for long-term archive and digital preservation. If you have data residency requirements that can't be met by an existing AWS Region, you can use the S3 Outposts storage class to store your S3 data on-premises. Amazon S3 also offers capabilities to manage your data throughout its lifecycle. Once an S3 Lifecycle policy is set, your data will automatically transfer to a different storage class without any changes to your application.

### NEW QUESTION # 461

[Design Secure Architectures]

A company wants to use Amazon Elastic Container Service (Amazon ECS) clusters and Amazon RDS DB instances to build and run a payment processing application. The company will run the application in its on-premises data center for compliance purposes. A solutions architect wants to use AWS Outposts as part of the solution. The solutions architect is working with the company's operational team to build the application.

Which activities are the responsibility of the company's operational team? (Select THREE.)

- A. Managing the virtualization hypervisor, storage systems, and the AWS services that run on Outposts
- B. Availability of the Outposts infrastructure including the power supplies, servers, and networking equipment within the Outposts racks
- C. **Physical security and access controls of the data center environment**
- D. **Providing extra capacity for Amazon ECS clusters to mitigate server failures and maintenance events**
- E. Physical maintenance of Outposts components
- F. **Providing resilient power and network connectivity to the Outposts racks**

**Answer: C,D,F**

Explanation:

These answers are correct because they reflect the customer's responsibilities for using AWS Outposts as part of the solution. According to the AWS shared responsibility model, the customer is responsible for providing resilient power and network connectivity to the Outposts racks, ensuring physical security and access controls of the data center environment, and providing extra capacity for Amazon ECS clusters to mitigate server failures and maintenance events. AWS is responsible for managing the virtualization hypervisor, storage systems, and the AWS services that run on Outposts, as well as the availability of the Outposts infrastructure including the power supplies, servers, and networking equipment within the Outposts racks, and the physical maintenance of Outposts components.

## NEW QUESTION # 462

A company runs a shopping application that uses Amazon DynamoDB to store customer information. In case of data corruption, a solutions architect needs to design a solution that meets a recovery point objective (RPO) of 15 minutes and a recovery time objective (RTO) of 1 hour.

What should the solutions architect recommend to meet these requirements?

- A. **Configure DynamoDB point-in-time recovery. For RPO recovery, restore to the desired point in time.**
- B. Configure DynamoDB global tables. For RPO recovery, point the application to a different AWS Region.
- C. Export the DynamoDB data to Amazon S3 Glacier on a daily basis. For RPO recovery, import the data from S3 Glacier to DynamoDB.
- D. Schedule Amazon Elastic Block Store (Amazon EBS) snapshots for the DynamoDB table every 15 minutes. For RPO recovery, restore the DynamoDB table by using the EBS snapshot.

**Answer: A**

## NEW QUESTION # 463

A company hosts an application on Amazon EC2 On-Demand Instances in an Auto Scaling group. Application peak hours occur at the same time each day. Application users report slow application performance at the start of peak hours. The application performs normally 2-3 hours after peak hours begin. The company wants to ensure that the application works properly at the start of peak hours.

Which solution will meet these requirements?

- A. Configure a dynamic scaling policy for the Auto Scaling group to launch new instances based on memory utilization
- B. Configure an Application Load Balancer to distribute traffic properly to the Instances.
- C. Configure a dynamic scaling policy for the Auto Scaling group to launch new instances based on CPU utilization.
- D. **Configure a scheduled scaling policy for the Auto Scaling group to launch new instances before peak hours.**

**Answer: D**

#### Explanation:

\* Understanding the Requirement: The application experiences slow performance at the start of peak hours, but normalizes after a few hours. The goal is to ensure proper performance at the beginning of peak hours.

#### \* Analysis of Options:

\* Application Load Balancer: Ensures proper traffic distribution but does not address the need to have sufficient instances running at the start of peak hours.

\* Dynamic Scaling Policy Based on Memory or CPU Utilization: While dynamic scaling reacts to usage metrics, it may not preemptively scale in anticipation of peak hours, leading to delays as new instances are launched and become available.

\* Scheduled Scaling Policy: This allows the Auto Scaling group to launch instances ahead of time, ensuring that enough instances are available and ready to handle the increased load right at the start of peak hours.

#### \* Best Solution:

\* Scheduled Scaling Policy: This approach ensures that new instances are launched and ready before peak hours begin, addressing the slow performance issue at the start of peak periods.
