It is time for you to plan your life carefully. After all, you have to make money by yourself. If you want to find a desirable job, you must rely on your ability to get the job. Now, our Integration-Architect study materials will help you master the popular skills in the office. Believe it or not, our Integration-Architect Study Materials will relieve you from poverty. It is important to make large amounts of money in modern society.

Our specialists check whether the contents of Integration-Architect real exam are updated every day. If there are newer versions, they will be sent to users in time to ensure that users can enjoy the latest resources in the first time. In such a way, our Integration-Architect guide materials can have such a fast update rate that is taking into account the needs of users. Users using our Integration-Architect Study Materials must be the first group of people who come into contact with new resources. When you receive an update reminder from Integration-Architect practice questions, you can update the version in time and you will never miss a key message.

Want to Get Salesforce Integration-Architect Certified? Polish Your Abilities and Make it Easy

Our Integration-Architect study braindumps are comprehensive that include all knowledge you need to learn necessary knowledge, as well as cope with the test ahead of you. With convenient access to our website, you can have an experimental look of free demos before get your favorite Integration-Architect prep guide downloaded. You can both learn useful knowledge and pass the exam with efficiency with our Integration-Architect Real Questions easily. We are on the way of meeting our mission and purposes of helping exam candidates to consider the exam as a campaign of success and pass the exam successfully.

Salesforce Certified Integration Architect Sample Questions (Q40-Q45):

NEW QUESTION # 40

A developer has been tasked by the integration architect to build a solution based on the Streaming API. The developer has done some research and has found there are different implementations of the events in Salesforce (PushTopic Events, Change Data Capture, Generic Streaming, Platform Events), but is unsure of how to proceed with the implementation and asks the system architect for some guidance.

What should the architect consider when making the recommendation?

- A. Change Data Capture does not have record access support.
- B. Change Data Capture can be published from Apex.
- C. PushTopic Events can define a custom payload.

Answer: A

NEW QUESTION # 41

Northern Trail Outfitters (NTO) has an affiliate company that would like immediate notifications of changes to opportunities in the

NTO Salesforce instance. The affiliate company has a CometD client available. Which solution is recommended in order to meet the requirement?

- A. Create a PushTopic update event on the Opportunity object to allow the subscriber to react to the streaming API.
- B. Create a connected app in the affiliate org and select "Accept CometD API Requests".
- C. Implement a polling mechanism in the client that calls the SOAP API getUpdated method to get the ID values of each updated record.

Answer: A

Explanation:

To provide "immediate notifications" to a client that already supports CometD, the architect must utilize Salesforce's Streaming API. PushTopic Events are the classic Streaming API implementation for broadcasting changes to specific records. A PushTopic is a definition that includes a SOQL query and a set of trigger events (Create, Update, Delete). When an Opportunity in NTO's instance is updated and matches the query, Salesforce automatically pushes a notification to the topic's channel. The affiliate's CometD client, having subscribed to this channel, receives the data payload instantly. Option A (Polling) is the architectural opposite of "immediate notifications". Polling is inefficient, consumes API limits, and introduces latency between the actual record change and the client's discovery of that change. Option C is incorrect as there is no "Accept CometD" setting in a Connected App; while a Connected App is used for OAuth authentication, the PushTopic is the mechanism that actually defines and delivers the stream. By using PushTopic, NTO provides a decoupled, event-driven architecture that fulfills the requirement for real-time visibility while minimizing the technical burden on the affiliate's infrastructure.

NEW QUESTION # 42

A customer of Salesforce has used Platform Events to integrate their Salesforce instance with an external third-party Artificial Intelligence (AI) system. The AI system provides a prediction score for each lead that is received by Salesforce. Once the prediction score is received, the lead information is saved to Platform events for other processes. The trigger on the Platform Events is failing once this was rolled out to Production.

What type of monitoring should the Integration Consultant have considered to monitor this integration?

- A. Monitor Platform Events created per hour limits across the Salesforce instance.
- B. Set up debug logs for Platform Event triggers to monitor performance.
- C. Monitor the volume of leads that are created in Salesforce.
- D. Validate the Platform Event definition matches leads definition.

Answer: A

Explanation:

The integration consultant should have considered monitoring the Platform Events created per hour limits across the Salesforce instance. This is because Platform Events have a limit on the number of events that can be published or delivered per hour, depending on the edition and license type. If this limit is exceeded, the trigger on the Platform Events may fail or be delayed. Option B is not correct because debug logs for Platform Event triggers are not useful for monitoring performance. Debug logs are used for troubleshooting issues or errors in the trigger logic, not for measuring the throughput or latency of the events. Option C is not correct because validating the Platform Event definition matches leads definition is not a monitoring task, but a design task. The integration consultant should have ensured that the Platform Event definition matches leads definition before deploying the integration to production. Option D is not correct because monitoring the volume of leads that are created in Salesforce is not relevant for this integration. The volume of leads does not affect the trigger on the Platform Events, as long as the Platform Events created per hour limits are not exceeded.

NEW QUESTION # 43

A customer imports data from an external system into Salesforce using Bulk API. These jobs have batch sizes of 2000 and are run in parallel mode. The batch fails frequently with the error "Max CPU time exceeded". A smaller batch size will fix this error.

Which two options should be considered when using a smaller batch size?

Choose 2 answers

- A. Smaller batch size may increase time required to execute bulk jobs.
- B. Smaller batch size may exceed the concurrent API request limits.
- C. Smaller batch size may cause record-locking errors.
- D. Smaller batch size can trigger "Too many concurrent batches" error.

Answer: A,C

Explanation:

Explanation

The error "Max CPU time exceeded" occurs when a batch of records takes more than 10 minutes to process in the Bulk API. Using a smaller batch size can reduce the processing time and avoid this error. However, there are some trade-offs to consider when using a smaller batch size, such as:

Answer A is valid because a smaller batch size may cause record-locking errors if multiple batches try to update the same records or records that are related by a lookup or master-detail relationship. This can result in concurrency issues and data inconsistency¹

Answer B is valid because a smaller batch size may increase the time required to execute bulk jobs, as more batches need to be created and processed sequentially. This can affect the performance and efficiency of the integration¹ Answer C is not valid because a smaller batch size may not exceed the concurrent API request limits, as the Bulk API does not count against the concurrent request limit. The Bulk API has its own limit on the number of batches that can be queued or in progress, which is 5,000 per rolling 24-hour period² Answer D is not valid because a smaller batch size can trigger "Too many concurrent batches" error only if the number of batches exceeds the limit of 5,000 per rolling 24-hour period. This error is not related to the parallel mode of the Bulk API, which allows up to 10 batches to be processed simultaneously

NEW QUESTION # 44

Universal Containers is a global financial company that sells financial products and services including, bank accounts, loans, and insurance. UC uses Salesforce Service cloud to service their customer via calls, live chat.

The support agents would open bank accounts on the spot for customers who are inquiring about UC bank accounts.

UC Core banking system is the system of record for bank accounts and all accounts opened in salesforce have to be synced in real-time to the core banking system. Support agents need to inform the customers with the newly created bank account ID which has to be generated from the core banking system.

Which integration pattern is recommended for this use case?

- **A. Use request and reply.**
- B. Use salesforce platform event.
- C. Use streaming API to generate push topic.
- D. Use outbound message.

Answer: A

Explanation:

Explanation

Using request and reply is the recommended integration pattern for this use case because it allows the support agents to send a request to the core banking system and receive a response with the bank account ID in real-time. This way, the support agents can inform the customers with the newly created bank account ID without any delay or inconsistency. Using streaming API to generate push topic is not a good solution because it is used for event-driven integration, not for web-service integration. Using outbound message is also not a good solution because it is a Salesforce-specific feature that uses SOAP web services, which may not be compatible with the core banking system. Using Salesforce platform event is also not a good solution because it is used for event-driven integration, not for web-service integration.
