WGU Web Development Applications Sample Questions (Q96-Q101):

NEW QUESTION # 96

Which programming paradigm best describes JavaScript?

- A. Event-driven
- B. Function-driven
- C. Object-oriented
- **D. Object-based**

Answer: D

Explanation:

JavaScript is often described as an object-based language, meaning it is centered around objects. While it supports object-oriented programming (OOP) concepts, it is more accurate to describe it as object-based due to its prototypal inheritance model rather than classical inheritance.

* Object-Based: JavaScript is built around objects and supports the creation and manipulation of objects.

* Object-Oriented Features: JavaScript supports OOP principles like encapsulation, inheritance, and polymorphism, but through prototype chains rather than class-based inheritance.

* Functional and Event-Driven: JavaScript supports functional programming and is often used in an event-driven manner, particularly in the context of web browsers.

NEW QUESTION # 97

Which layout method causes images to render to small or too large in browser windows of different sizes?

- A. Fluid
- **B. Fixed width**
- C. Relative width
- D. Liquid

Answer: B

Explanation:

A fixed-width layout method specifies exact pixel values for widths. This approach does not adapt to different screen sizes, leading to images rendering too small or too large on various devices.

* Fixed Width Layout:

* Definition: Uses specific pixel values for the width of elements.

* Example:

```
container {  
width: 800px;  
}
```

* Issues:

* Lack of Flexibility: Does not scale with the size of the viewport, causing images and other elements to appear incorrectly sized on different screen sizes.

* Comparison:

* Fluid/Liquid: Adapts to the screen size using percentages or other relative units.

* Relative Width: Also adapts using units like em or %.

* References:

* MDN Web Docs - Fixed vs. Fluid Layout

* W3C CSS Flexible Box Layout Module Level 1

Using fixed-width layouts can result in poor user experience across different devices, highlighting the importance of responsive design principles.

NEW QUESTION # 98

A JavaScript programmer defines the following function:

```
function square(number) {
  return number * number;
}
```

What is the name of the function?

- A. Return
- B. Function
- C. Number
- **D. square**

Answer: D

Explanation:

In JavaScript, the name of a function is defined after the function keyword and before the parentheses that enclose its parameters.

* **Function Name:** The function name is the identifier used to call the function. It is defined immediately after the function keyword.

* **Usage Example:**

```
function square(number) {
  return number * number;
}
```

In this example, the name of the function is square.

NEW QUESTION # 99

Given the following CSS code:

```
#delay {
  font-size: 14px;
  transition-property: font-size;
  transition-duration: 4s;
  transition-delay: 2s;
}

#delay:hover {
  font-size: 20px;
}
```

How many seconds elapse before the font-size property begins to increase when a user hovers a mouse pointer over the delay element?

- A. 0
- **B. 1**
- C. 2
- D. 3

Answer: B

Explanation:

The CSS transition-delay property specifies how long to wait before starting a property transition. In the given CSS code, the transition-delay is set to 2s.

* **CSS Transition Properties:**

* **transition-property:** Specifies the CSS property to which the transition is applied (font-size in this case).

* **transition-duration:** Specifies how long the transition takes (4s).

* **transition-delay:** Specifies the delay before the transition starts (2s).

Example:

* **Given HTML:**

```
<div id="delay">Hover over me</div>
```

* **Given CSS:**

```
#delay {
  font-size: 14px;
  transition-property: font-size;
  transition-duration: 4s;
  transition-delay: 2s;
}
```

```
}
#delay:hover {
font-size: 36px;
}
```

Explanation: When a user hovers over the element with id="delay", it will wait for 2 seconds before the transition effect on font-size starts.

NEW QUESTION # 100

Which code segment creates a slider field that accepts a numeric value ranging from 1 through 10?

- A. `<input type="number" name="sat-level" min="1" max="10">`
- B. `<input type="range" name="sat-level" min="1" max="10">`
- C. `<input type="range" name="sat-level" max="10">`
- D. `<input type="number" name="sat-level" max="10">`

Answer: B

Explanation:

> "To create a slider control, use `<input type="range">` and specify `min` and `max` attributes to define the allowable range."

>

> Only Option B includes both `min` and `max`, and uses `type="range"`, which creates a slider.
