

# Plat-Dev-301 Exam Revision Plan, Exam Plat-Dev-301 Experience

## Plat-Dev-301

Correct Answer: D

**QUESTION: 7**

An environment has two Apex Triggers: an after-update trigger on Account and an after-update trigger on Contact. The Account after-update trigger fires whenever an Account's address is updated, and it updates every associated Contact with that address. The Contact after-update trigger fires on every edit, and it updates every Campaign Member record related to the Contact with the Contact's state. Consider the following: A mass update of 200 Account records' addresses, where each Account has 50 Contacts. Each Contact has 1 Campaign Member. This means there are 10,000 Contact records across the Accounts and 10,000 Campaign Member records across the contacts. What will happen when the mass update occurs?

Option A : The mass update will fail, since the two triggers fire in the same context, thus exceeding the number of records processed by DML statements.  
Option B : There will be no error, since each trigger fires within its own context and each trigger does not exceed the limit of the number of records processed by DML statements.  
Option C : There will be no error, since the limit on the number of records processed by DML statements is 50,000.  
Option D : The mass update of Account address will succeed, but the Contact address updates will fail due to exceeding number of records processed by DML statements.

Correct Answer: B

**QUESTION: 8**

Which type of controller is best suited when you want all of the basic DML functions from an object's normal new/edit page and want to include multiple records?

Option A : Standard Controller  
Option B : Standard List/Set Controller  
Option C : Controller Extensions  
Option D : Custom Controller

Correct Answer: B

**QUESTION: 9**

A company wants to implement a new call center process for handling customer service calls. It requires service reps to ask for the caller's account number before proceeding with the rest of their call script. Following best practices, what should a developer use to meet this requirement?

Option A : Approvals  
Option B : Flow Builder  
Option C : Apex Trigger  
Option D : Process Builder

## High-quality Plat-Dev-301 Exam Revision Plan & Useful Exam Plat-Dev-301 Experience Ensure You a High Passing Rate

In order to meet the need of all customers, there are a lot of professionals in our company. We can promise that we are going to provide you with 24-hours online efficient service after you buy our Salesforce Certified Platform Developer II - Multiple Choice guide torrent. We are willing to help you solve your all problem. If you purchase our Plat-Dev-301 test guide, you will have the right to ask us any question about our products, and we are going to answer your question immediately, because we hope that we can help you solve your problem about our Plat-Dev-301 Exam Questions in the shortest time. We can promise that our online workers will be online every day. If you buy our Plat-Dev-301 test guide, we can make sure that we will offer you help in the process of using our Plat-Dev-301 exam questions. You will have the opportunity to enjoy the best service from our company.

### Salesforce Certified Platform Developer II - Multiple Choice Sample Questions (Q26-Q31):

#### NEW QUESTION # 26

A corporation has many different Salesforce orgs, with some different objects and some common objects, and wants to build a single Java application that can create, retrieve, and update common object records in all of the different orgs. Which method of integration should the application use?

- A. SOAP API with the Partner WSDL
- B. Metadata APT
- C. Apex REST Web Service
- D. SOAP API with the Enterprise WSDL

**Answer: A**

Explanation:

The SOAP API with the Partner WSDL is ideal for building integrations that work across multiple Salesforce orgs, especially when they have varying schemas. The Partner WSDL is designed to be flexible and dynamic, catering to different metadata.

#### NEW QUESTION # 27

A developer creates an application event that has triggered an infinite loop. What may have caused this problem?

- A. The event has multiple handlers registered in the project.
- B. An event is fired 'ontouchend" and is unhandled.
- C. The event handler calls a trigger.
- D. The event is fired from a custom renderer.

**Answer: A**

Explanation:

The infinite loop in the application event could be caused by multiple handlers registered in the project. If the event is fired and then handled in such a way that the handling leads to the event being fired again, this can create a loop. Care must be taken to ensure that the handling of the event does not re-trigger the same event unintentionally.

#### NEW QUESTION # 28

Universal Containers decided to use Salesforce to manage a new hire interview process. A custom object called Candidate was created with organization-wide defaults set to Private. A lookup on the Candidate object sets an employee as an Interviewer. What should be used to automatically give Read access to the record when the lookup field is set to the Interviewer user?

- A. The record can be shared using an Apex class.

- B. The record can be shared using a permission set.
- C. The record cannot be shared with the current setup.
- **D. The record can be shared using a sharing rule.**

**Answer: D**

Explanation:

A sharing rule can be used to automatically give Read access to a user specified in a lookup field. Sharing rules are declarative and can be based on criteria such as the value of a lookup field. This can be done without writing code and is maintainable through the Salesforce UI.

### NEW QUESTION # 29

A page throws an 'Attempt to dereference a null object' error for a Contact.  
What change in the controller will fix the error?

- A. Declare a static final Contact at the top of the controller.
- **B. Use a condition in the getter to return a new Contact if it is null.**
- C. Change the getter's signature to be static Contact.

**Answer: B**

Explanation:

The error 'Attempt to dereference a null object' often occurs when trying to access a member of a null object. By checking if the object is null in the getter method and returning a new instance if it is, the error can be prevented.

Apex Developer Guide

### NEW QUESTION # 30

A developer is inserting, updating, and deleting multiple lists of records in a single transaction and wants to ensure that any error prevents all execution.

How should the developer implement error exception handling in their code to handle this?

- A. Use a try-catch statement and handle DML cleanup in the catch statement,
- **B. Use Database.setSavepoint {} and Database.rollback with a try-catch statement.**
- C. Use a try-catch and use sObject.addError() on any failures.
- D. Use Database methods to obtain lists of Database.SaveResults.

**Answer: B**

Explanation:

Using Database.setSavepoint() and Database.rollback() within a try-catch statement is the recommended approach for handling transactions that involve multiple DML operations. This allows the developer to roll back all changes if an error occurs, ensuring that partial changes are not committed to the database.

### NEW QUESTION # 31

.....

The Plat-Dev-301 certification verifies that you are a skilled professional. Pass4cram product is designed by keeping all the rules and regulations in focus that Salesforce publishes.
