Oracle 1z0-076 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">Using Oracle Active Data Guard: Supported Workloads in Read-Only Standby Databases: Here, the usage of physical standby databases for real-time queries is discussed.
Topic 2	<ul style="list-style-type: none">Backup and Recovery Considerations in an Oracle Data Guard Configuration: In this topic, Backup and recovery procedures in a Data Guard configuration are discussed, including RMAN backups, offloading to physical standby, and network-based recovery.
Topic 3	<ul style="list-style-type: none">Enhanced Client Connectivity in a Data Guard Environment: This topic focuses on enhancing client connectivity in a Data Guard setup and implementing failover procedures for seamless client redirection. It also covers application continuity to ensure uninterrupted operations during role transitions.

Topic 4	<ul style="list-style-type: none"> Creating a Logical Standby Database: This topic guides users through the process of creating and managing a logical standby database, including SQL Apply filtering.
Topic 7	<ul style="list-style-type: none"> Managing Oracle Net Services in a Data Guard Environment: The section focuses on Oracle Net Services and its role in Data Guard networking setup.
Topic 8	<ul style="list-style-type: none"> Performing Role Transitions: Here, the concept of database roles is explained, along with the steps for performing switchovers, failovers, and maintaining physical standby sessions during role transitions.
Topic 9	<ul style="list-style-type: none"> Using Flashback Database in a Data Guard Configuration: This topic covers the configuration and advantages of using Flashback Database in a Data Guard setup, as well as the process of enabling fast-start failover for seamless role changes.
Topic 10	<ul style="list-style-type: none"> Oracle Data Guard Basics: This topic covers the essential architecture and concepts of Oracle Data Guard. It includes sub-topics such as the physical and logical standby database comparison, benefits of Data Guard, and its integration with multi-tenant databases.
Topic 11	<ul style="list-style-type: none"> Managing Physical Standby Files After Structural Changes on the Primary Database: The topic covers managing structural changes in the primary database and their impact on physical standby files.

Oracle 1z0-076 Dumps-Effective Tips To Pass [2026]

The experts in our company are always keeping a close eye on even the slightest change on the 1z0-076 exam questions in the field. Therefore, we can assure that you will miss nothing needed for the 1z0-076 exam. What's more, the latest version of our 1z0-076 Study Materials will be a good way for you to broaden your horizons as well as improve your skills. You will certainly obtain a great chance to get a promotion in your company.

Oracle Database 19c: Data Guard Administration Sample Questions (Q31-Q36):

NEW QUESTION # 31

Which three Data Guard monitoring activities may be performed using Enterprise Manager Cloud Control?

- A. You can check the potential data loss in the event of a disaster.
- B. You can check if redo apply needs to be tuned.
- C. You can set a critical threshold on the redo generation rate metric for a primary database.
- D. You can monitor the redo apply rate on a logical standby database.
- E. You can set a warning threshold on the redo generation rate metric for a physical standby database.
- F. You can monitor the redo apply rate on a snapshot standby database.

Answer: A,C,D

NEW QUESTION # 32

Which two statements are true when using non-rolling release upgrades in a Data Guard environment?

- A. Modifications to the data dictionary on the primary database caused by the upgrade, are applied on a logical standby database.
- B. The compatible parameter on a standby database that is applying redo, must be equal to or greater than the compatible parameter on the primary that is shipping redo to that standby.
- C. During the upgrade of a logical standby database, standby redo log files must reside on O/S file systems.
- D. Modifications to the data dictionary on the primary database caused by the upgrade, are applied on a physical standby database.
- E. User equivalence must be established for the owner of the Oracle software on the affected hosts prior to the upgrade.

Answer: B,D

Explanation:

The compatible parameter on a standby database that is applying redo, must be equal to or greater than the compatible parameter on the primary that is shipping redo to that standby (A): This ensures that the standby database can apply redo from the primary, even after the primary has been upgraded. The COMPATIBLE parameter setting on the standby database should not preclude it from understanding the redo it receives.

Modifications to the data dictionary on the primary database caused by the upgrade, are applied on a physical standby database (C): When the primary database undergoes a non-rolling upgrade, any resulting data dictionary changes are transmitted through redo data and applied to the physical standby database.

NEW QUESTION # 33

You detected an unrecoverable archive gap in your data guard environment. So, you need to roll standby forward in time without applying a large number of archive log files using this command:

RMAN> RECOVER STANDBY DATABASE FROM SERVICE-<primary database name>;

When running this command, which of the following steps can be performed automatically?

1. Remember all data file names on the standby.
2. Restart standby in nomount.
3. Restore controlfile from primary.
4. Mount standby database.
5. Rename data files from stored standby names.
6. Restore new data files to new names.
7. Recover standby.

- A. 1,2,3,4,5,6,7
- B. 2,3,5,6,7
- C. 1,3,5,6,7
- D. 2,3,6,7
- E. 1, 2,3,4,6,7

Answer: E

Explanation:

The RECOVER STANDBY DATABASE FROM SERVICE command in RMAN is designed to automate various steps required to recover the standby database, especially when dealing with an archive gap. When this command is executed, the following actions can occur automatically:

Remember all data file names on the standby (1): RMAN has the capability to recall the names and paths of all data files associated with the standby database.

Restart standby in nomount (2): The standby database can be automatically restarted in the NOMOUNT state, allowing recovery operations to proceed without the database being open.

Restore controlfile from primary (3): RMAN can restore the control file from the primary database to the standby system, ensuring that the standby has the most up-to-date control file.

Mount standby database (4): After restoring the control file, the standby database is mounted to prepare for data file recovery.

Rename data files from stored standby names (5): Not typically done automatically by this command.

Restore new data files to new names (6): New data files added to the primary since the last synchronization can be restored to the standby with their correct names.

Recover standby (7): Finally, RMAN will apply any necessary redo logs to bring the standby database up to date with the primary. While some steps, such as renaming data files (5), typically require manual intervention or scripting, most of the recovery process can be handled by RMAN automatically, streamlining the recovery of the standby database.

NEW QUESTION # 34

Which THREE statements are true..... open in real time query mode, which becomes a new.

- A. User sessions and Current Buffers are maintained by default.
- B. Sessions that are using database links
- C. All sessions are disconnected and all
- D. Sessions that have long running queries can be retained.
- E. User sessions can be retained.
- F. All current buffers can be retained.

Answer: C,E,F

Explanation:

When a physical standby database is opened in real-time query mode, which may be referred to as real-time apply when using Active Data Guard, certain operations can disrupt ongoing sessions. However, with features like Application Continuity and the proper configuration of initialization parameters such as STANDBY_DB_PRESERVE_STATES, user sessions and current buffers may be preserved during role transitions such as a switchover or failover. Specifically, the STANDBY_DB_PRESERVE_STATES parameter can be set to preserve none, all, or only user sessions during such transitions. This ensures that in-flight transactions are not lost and that users do not experience disruptions during the role transitions of a physical standby database.

NEW QUESTION # 35

Which THREE are true about using flashback database in a Data Guard environment?

- A. When a flashback database operation is performed on a primary database, a physical standby database is also flashed back automatically.
- B. You can use it when real-time apply is enabled in case the phyt may not be used to flash back a primary database after a failover to a logical standby.
- C. It may be used to flash back a physical standby that receives redo from a far sync instance.
- D. It may not be used to flash back a primary database after a failover to a physical standby.
- E. When a flashback database operation is performed on a primary database, a logical standby database is also flashed back automatically.
- F. You can use it when real-time apply is enabled in case the physical standby suffers from logical corruption.

Answer: C,D,F

Explanation:

Flashback Database is a feature that allows reverting a database to a previous point in time, which is extremely useful in various Data Guard configurations:

It may be used to flash back a physical standby that receives redo from a far sync instance (C): Flashback Database can be used on a physical standby database to revert it to a past point in time, even when it is receiving redo data from a far sync instance. This can be particularly useful to recover from logical corruptions or unwanted changes.

You can use it when real-time apply is enabled in case the physical standby suffers from logical corruption (D): Even when real-time apply is enabled, which allows redo data to be applied to the standby database as soon as it is received, Flashback Database can be used to revert the physical standby database to a point in time before the logical corruption occurred.

It may not be used to flash back a primary database after a failover to a physical standby (E): After a failover has occurred from a primary to a physical standby database, making the standby the new primary, Flashback Database cannot be used to revert the old primary database to a state before the failover because the failover operation makes irreversible changes to the database role and configuration.
