Exam C_CPI_2506 Online, C_CPI_2506 Exam Topics

Many don't find real SAP Certified Associate - Integration Developer exam questions and face loss of money and time.

TestSimulate made an absolute gem of study material which carries actual SAP Certified Associate - Integration Developer (C_CPI_2506) Exam Questions for the students so that they don't get confused in order to prepare for SAP Certified Associate - Integration Developer (C_CPI_2506) exam and pass it with a good score. The C_CPI_2506 practice test questions are made by examination after consulting with a lot of professionals and receiving positive feedback from them.

SAP Certified Associate - Integration Developer Sample Questions (Q41-Q46):

NEW QUESTION # 41

What are some advantages of creating an OData interface through an API provider? Note: There are 2 correct answers to this question.

- A. Automatic creation of a Swagger UI
- B. Automatic creation of a RAML specification
- C. Automatic creation of an openAPI specification
- D. Automatic creation of a WSDL specification

Answer: A,C

Explanation:

Some advantages of creating an OData interface through an API provider are automatic creation of a Swagger UI and an openAPI specification. A Swagger UI is a web-based tool that allows you to interact with the OData service and test its functionality. An openAPI specification is a standard format for describing the OData service and its metadata, which can be used by other tools and applications. NEW QUESTION # 42

How do event-driven architectures enable organizations respond quickly to changing market demands and maintain operational stability during unforeseen issues?

- A. They enable real-time processing of data, enabling organizations react swiftly to market shifts and maintain stability by decoupling components for flexible scaling and increased fault tolerance.
- B. They prioritize batch processing of data, that hinders rapid responses to market changes and increases system complexity.
- C. They rely on tightly coupled components, that limit scalability and make them vulnerable to cascading failures during unexpected disruption.
- D. They require extensive manual intervention for data processing, that slows reactions to market shifts and reduces operational efficiency.

Answer: A

Explanation:

Event-Driven Architectures (EDA) provide real-time responsiveness and resilience by:

Real-time data processing # Immediate reaction to business events (e.g., order creation, stock changes).

Decoupling of components # Producers and consumers are independent, allowing flexible scaling.

Fault tolerance # Failures in one component do not propagate due to event buffering and loose coupling.

Incorrect options:

A # Batch processing delays responsiveness.

C # EDA minimizes manual intervention.

D # Tight coupling is opposite to EDA principles.

NEW QUESTION # 43

Using the Test Connectivity function, you want to test a connection to a backend system. The connection is provided by a Cloud Connector. Which parameter is required for the connection test?

- A. Subaccount ID
- B. Connector ID
- C. Host
- D. Location ID

Answer: D

Explanation:

To test a connection to a backend system that is provided by a Cloud Connector, you must specify the location ID as a parameter for the connection test. The location ID is a unique identifier that represents a Cloud Connector instance in a specific network location. It is used to route requests from SAP Integration Suite to the correct Cloud Connector instance and then to the backend system. You can find the location ID in the Cloud Connector administration UI under Configuration Location ID. Reference: Cloud Connector Connectivity Tests | SAP Help Portal, Cloud Connector Configuration | SAP Help Portal

NEW QUESTION # 44

Which architectural pattern in an event-driven architecture allows direct communication between two parties without an intermediary?

- A. Point-to-Point
- B. Publish-Subscribe
- C. Event Sourcing
- D. Message Queue

Answer: A

Explanation:

References

In an event-driven architecture (EDA), several messaging patterns exist:

Point-to-Point # Enables direct communication between exactly two parties (sender and receiver) without intermediaries.

Publish-Subscribe # Multiple consumers subscribe to events; requires a broker/intermediary (like Event Mesh).

Message Queue # Relies on a queue as an intermediary between producer and consumer.

Event Sourcing # Refers to storing state changes as events, not a communication pattern.

Therefore, the only pattern allowing direct communication without an intermediary is Point-to-Point.

NEW QUESTION # 45

What does the messaging model of the Apache Camel Data Model consist of?

- A. Header, body, attachment
- B. Header, Exchange ID, in-message
- C. Header, body, properties
- D. Header, properties, attachment

Answer: A

Explanation:

The messaging model of the Apache Camel Data Model consists of three parts: header, body, and attachment. The header contains information related to the message, such as addressing, routing, or metadata. The body contains the payload or the content of the message. The attachment contains optional data that can be attached to the message, such as files or images. The Apache Camel Data Model is used by SAP Integration Suite to process messages of any format using various components and data formats.
