WGU Managing Cloud Security (JY02) Sample Questions (Q66-Q71):

NEW QUESTION # 66

Which group should be notified for approval when a planned modification to an environment is scheduled?

- A. Problem management team
- **B. Change management board**
- C. Event management team
- D. Executive management board

Answer: B

Explanation:

The Change Management Board (CMB), also called the Change Advisory Board (CAB), is the formal authority responsible for reviewing, assessing, and approving planned modifications to IT environments. This group ensures that proposed changes align with business objectives, do not introduce unnecessary risks, and comply with security and regulatory requirements.

Event management teams focus on monitoring events, problem management teams handle root-cause analysis, and executive boards provide strategic direction but are not operational approval authorities. Only the CMB has the explicit role of validating technical and security implications before implementation.

By involving the CMB, organizations enforce structured governance, minimize disruptions, and establish accountability. This practice is central in ITIL and ISO/IEC 20000 standards, ensuring that operational integrity and security are preserved during change cycles.

NEW QUESTION # 67

Which concept focuses on operating highly available workloads in the cloud?

- **A. Reliability**
- B. Resource hierarchy
- C. Operational excellence
- D. Security

Answer: A

Explanation:

Reliability in cloud design ensures workloads can recover quickly from disruptions and continue operating as expected. This concept focuses on high availability, fault tolerance, and disaster recovery. Reliability requires implementing redundancy, backup strategies, and robust monitoring.

Security ensures data protection, operational excellence covers continuous improvement, and resource hierarchy refers to organizational structures, but none focus specifically on availability and resilience.

By prioritizing reliability, organizations design cloud architectures capable of withstanding failures at multiple layers—compute, storage, networking, and even regions. This design principle ensures customer trust and compliance with service-level agreements.

NEW QUESTION # 68

Which section of a contract includes the customer's right to audit the vendor to verify whether the vendor is fulfilling its contractual obligations?

- A. Termination
- B. Indemnification
- **C. Assurance**
- D. Litigation

Answer: C

Explanation:

The Assurance section of a contract specifies the customer's rights to verify that the vendor is meeting contractual and compliance obligations. This often includes the right to audit, request independent certifications, or require compliance reports such as SOC 2 or ISO 27001.

Indemnification deals with liability coverage, termination outlines exit conditions, and litigation describes dispute resolution mechanisms. None of these provide the customer with ongoing oversight rights.

Audit rights are critical in cloud contracts to maintain transparency, enforce accountability, and verify that shared responsibility is being upheld. Assurance provisions give customers confidence in the provider's security and operational practices, ensuring compliance with industry regulations.

NEW QUESTION # 69

Which business area in the enterprise risk management (ERM) strategy is concerned with formal risk assessments when forming new or renewing existing vendor relationships?

- A. Quality assurance
- B. Software development
- C. Marketing
- **D. Procurement**

Answer: D

Explanation:

The procurement function is directly responsible for vendor selection and contract management, including risk assessments of new or renewed vendor relationships. This ensures that third-party providers meet security, compliance, and performance requirements. Software development and quality assurance focus on product creation and validation. Marketing manages branding and outreach. None of these directly involve evaluating external vendor risk.

Procurement integrates due diligence, contract clauses, and performance monitoring into enterprise risk management. This reduces exposure to third-party threats and ensures compliance with frameworks such as ISO 27036 (supplier relationships) and NIST vendor risk management guidelines.

NEW QUESTION # 70

An engineer has been given the task of ensuring all of the keys used to encrypt archival data are securely stored according to industry standards. Which location is a secure option for the engineer to store encryption keys for decrypting data?

- **A. An escrow that is kept separate from the data it is tied to**
- B. An escrow that is kept local to the data it is tied to
- C. A repository that is made public
- D. A repository that is made private

Answer: A

Explanation:

Industry best practice requires that encryption keys are stored separately from the data they protect. This ensures that if the data storage system is compromised, attackers cannot immediately decrypt sensitive information. The use of a secure escrow system is a recognized approach.

An escrow provides controlled storage for encryption keys, ensuring they are only accessible by authorized processes and not co-located with the protected data. Keeping keys "local" to the data creates a single point of failure. A public or private repository without specialized protection mechanisms would also be insufficient due to risks of insider threats or misconfiguration.

By placing keys in an independent escrow system, the organization enforces separation of duties, strengthens defense-in-depth, and aligns with cryptographic standards from NIST and ISO. This practice is vital when dealing with archival data, where long-term confidentiality must be preserved even as systems evolve.
