Valid Exam Identity-and-Access-Management-Architect Blueprint | Identity-and-Access-Management-Architect Reliable Exam Question

Our Identity-and-Access-Management-Architect exam torrent is available in different versions. Whether you like to study on a computer or enjoy reading paper materials, our test prep can meet your needs. Our PDF version of the Identity-and-Access-Management-Architect quiz guide is available for customers to print. You can print it out, so you can practice it repeatedly conveniently. And our Identity-and-Access-Management-Architect exam torrent make it easy for you to take notes on it so that your free time can be well utilized and you can often consolidate your knowledge. Everything you do will help you successfully pass the exam and get the card. The version of APP and PC of our Identity-and-Access-Management-Architect Exam Torrent is also popular. They can simulate real operation of test environment and users can test Identity-and-Access-Management-Architect test prep in mock exam in limited time. They are very practical and they have online error correction and other functions. The characteristic that three versions of Identity-and-Access-Management-Architect exam torrent all have is that they have no limit of the number of users, so you don't encounter failures anytime you want to learn our Identity-and-Access-Management-Architect quiz guide. The three different versions can help customers solve any questions and meet their all needs.

Salesforce Certified Identity and Access Management Architect Sample Questions (Q238-Q243):

NEW QUESTION # 238

Universal Containers (UC) is considering a Customer 360 initiative to gain a single source of the truth for its customer data across disparate systems and services. UC wants to understand the primary benefits of Customer 360 Identity and how it contributes to a successful Customer 360 Truth project.

What are two key benefits of Customer 360 Identity as it relates to Customer 360?

Choose 2 answers

- A. Customer 360 Identity not only provides a unified sign up and sign in experience, but also tracks anonymous user activity prior to signing up so organizations can understand user activity before and after the users identify themselves.
- B. Customer 360 Identity automatically integrates with Customer 360 Data Manager and Customer 360 Audiences to seamlessly populate all user data.
- C. Customer 360 Identity supports multiple brands so you can deliver centralized identity services and correlation of user activity, even if it spans multiple corporate brands and user experiences.
- D. Customer 360 Identity enables an organization to build a single login for each of its customers, giving the organization an understanding of the user's login activity across all its digital properties and applications.

Answer: C,D

Explanation:

Explanation

Customer 360 Identity is a cloud-based identity service that provides a single, trusted identity for customers across all your digital properties and applications². Customer 360 Identity has several benefits that relate to Customer 360, such as³:

Customer 360 Identity enables an organization to build a single login for each of its customers, giving the organization an understanding of the user's login activity across all its digital properties and applications. This helps to create a unified customer profile and deliver personalized experiences based on user preferences and behaviors³.

Customer 360 Identity supports multiple brands so you can deliver centralized identity services and correlation of user activity, even if it spans multiple corporate brands and user experiences. This helps to maintain brand consistency and loyalty while providing seamless access to your products and services³.

NEW QUESTION # 239

Universal Containers (UC) has a mobile application that it wants to deploy to all of its Salesforce users, including customer Community users. UC would like to minimize the administration overhead, which two items should an architect recommend? Choose 2 answers

- A. Enable the "High Assurance session required" setting in the Connected App.
- B. Enable the "All users may self-authorize" setting in the Connected App.
- C. Enable the "Refresh Tokens is valid until revoked" setting in the Connected App.
- D. Enable the "Enforce IP restrictions" settings in the connected App.

Answer: B,C

Explanation:

The two items that an architect should recommend for UC to minimize the administration overhead are:

* Enable the "Refresh Tokens is valid until revoked" setting in the Connected App. This setting allows the mobile app to obtain a refresh token from Salesforce when it obtains an access token. A refresh token can be used to obtain a new access token when the previous one expires or becomes invalid. By enabling this setting in the Connected App, UC can reduce the number of login prompts and authentication failures for its mobile users, as they can use the refresh token to renew their access without entering their credentials again.

* Enable the "All users may self-authorize" setting in the Connected App. This setting allows users to grant access to the mobile app without administrator approval. By enabling this setting in the Connected App, UC can simplify and speed up the deployment process for its mobile app, as they do not need to manually authorize each user or group of users.

The other options are not recommended items for this scenario. Enabling the "Enforce IP restrictions" setting in the Connected App would limit the mobile app access to certain IP ranges, which could prevent some users from accessing the app from different locations or networks. Enabling the "High Assurance session required" setting in the Connected App would require users to verify their identity with a second factor before accessing the mobile app, which could increase complexity and inconvenience for users.

NEW QUESTION # 240

An architect needs to set up a Facebook Authentication provider as login option for a Salesforce customer Community. What portion of the authentication provider setup associates a Facebook user with a Salesforce user?

- A. Federation ID
- B. User info endpoint URL
- C. Consumer key and consumer secret
- **D. Apex registration handler**

Answer: D

Explanation:

Explanation

D is correct because Apex registration handler is the portion of the authentication provider setup that associates a Facebook user with a Salesforce user when customers use their Facebook credentials to log in to the customer community. Apex registration handler is an Apex class that handles the logic for creating or updating a user record based on the information received from Facebook. A is incorrect because consumer key and consumer secret are portions of the authentication provider setup that identify and authenticate UC's customer community with Facebook, not associate a Facebook user with a Salesforce user. B is incorrect because Federation ID is an attribute that can be used to identify a user in a SAML assertion when UC uses SAML-based SSO with Facebook, not when UC uses social sign-on with Facebook. C is incorrect because user info endpoint URL is a portion of the authentication provider setup that specifies the URL to obtain the user information from Facebook, not associate a Facebook user with a Salesforce user. Verified References:

[Apex Registration Handler], [Consumer Key and Secret], [Federation ID], [User Info Endpoint URL]

NEW QUESTION # 241

Universal Containers (UC) has an e-commerce website where customers can buy products, make payments, and manage their accounts. UC decides to build a customer Community on Salesforce and wants to allow the customers to access the community for their accounts without logging in again. UC decides to implement SAML-Initiated SSO using a SAML-BASED compliant IDP. In this scenario where Salesforce is the service provider, which two activities must be performed in Salesforce to make SP-Initiated SSO work? Choose 2 answers

- **A. Configure SAML SSO settings.**
- B. Create a connected App
- **C. Set up my domain**
- D. Configure Delegated Authentication

Answer: A,C

Explanation:

Explanation

To enable SP-initiated SSO using a SAML-based identity provider, UC needs to configure SAML SSO settings in Salesforce and set up a custom domain using My Domain feature. This allows UC to specify the identity provider information, such as the issuer, entity ID, certificate, and SAML assertion attributes.

Delegated authentication is a different mechanism that allows Salesforce to delegate the authentication process to an external web service. A connected app is not required for SP-initiated SSO, but it is used for IDP-initiated SSO or OAuth flows. References: Certification - Identity and Access Management Architect - Trailhead, [Set Up My Domain], [Configure SAML Settings for Single Sign-On]

NEW QUESTION # 242

Universal Containers (UC) is looking to build a Canvas app and wants to use the corresponding Connected App to control where the app is visible. Which two options are correct in regards to where the app can be made visible under the Connected App setting for the Canvas app? Choose 2 answers

- A. As part of the body of a Salesforce Knowledge article.
- **B. The sidebar of a Salesforce Console as a console component.**
- **C. Included in the Call Control Tool that's part of Open CTI.**
- D. In the mobile navigation menu on Salesforce for Android.

Answer: B,C

Explanation:

The sidebar of a Salesforce Console as a console component and included in the Call Control Tool that's part of Open CTI are two options that are correct in regards to where the app can be made visible under the connected app settings for the Canvas app. A Canvas app is an external application that can be embedded within Salesforce using an iframe. A connected app is an application that integrates with Salesforce using APIs and uses OAuth as the authentication protocol. You can control where a Canvas app can be displayed in Salesforce by configuring the locations in the connected app settings. The sidebar of a Salesforce Console as a console component is a valid location for a Canvas app because it allows you to display the app as a collapsible panel on the side of any console app. Included in the Call Control Tool that's part of Open CTI is a valid location for a Canvas app because it allows you to display the app as part of the softphone panel that integrates with your telephony system. As part of the body of a Salesforce Knowledge article is not a valid location for a Canvas app because it is not supported by the connected app settings. In the mobile navigation menu on Salesforce for Android is not a valid location for a Canvas app because it is not supported by the connected app settings.
