The Appian ACD101 Certification is a valuable certificate that is designed to advance the professional career. With the Appian Associate Developer (ACD101) certification exam seasonal professionals and beginners get an opportunity to demonstrate their expertise. The Appian Associate Developer certification exam recognizes successful candidates in the market and provides solid proof of their expertise.

Appian ACD101 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">Appian Development: Records: This topic of the Appian Associate Developer exam assesses skills of developers in configuring records, including linking to data sources and designing views and lists. You will need to show proficiency in setting up record actions and relationships.
Topic 2	<ul style="list-style-type: none">Introduction to the Appian Platform: The Appian Associate Developer exam tests the familiarity of aspiring Appian developers with essential Appian resources like online docs and Appian Max, and their abilities to organize application structures. It measures your understanding of how to utilize the capabilities of Appian, such as process mining and RPA, to address business challenges effectively.
Topic 3	<ul style="list-style-type: none">Data Persistence: Here, the Appian Associate Developer test examines your skills in managing data and relational databases, including the use of CDTs and query entities. You will need to demonstrate proficiency in handling records, querying data, and updating data models.

Appian Associate Developer Sample Questions (Q77-Q82):

NEW QUESTION # 77

Which Appian feature is used to automate repetitive manual tasks such as extracting data from a system for which there is no API?

- **A. RPA**
- B. Process Mining
- C. Connected Systems

Answer: A

Explanation:

Robotic Process Automation (RPA) is the Appian feature designed to automate repetitive manual tasks, especially in scenarios where interacting with systems without APIs is necessary. RPA bots can mimic human actions, such as navigating through system interfaces, extracting data, and entering information, effectively bridging the gap between digital processes and systems that lack API integrations. This capability is particularly useful for integrating legacy systems into modern workflows, streamlining operations that would otherwise require manual intervention.

Reference:

Appian Documentation on RPA: Explains how RPA can be leveraged within Appian to automate tasks, providing examples and best practices for implementing RPA bots in business processes.

NEW QUESTION # 78

Review the following expression rule:

ri!name is defined as "Maria".

ri!directory is defined as the following:

What is the expected output?

- **A. 0**
- B. Maria
- C. 1

Answer: A

Explanation:

Given that ri!name is defined as "Maria" and ri!directory contains two a!map() structures, one of which includes the name "Maria," the expression wherecontains(ri!name, index(ri!directory, "name")) will evaluate as follows: The index() function will return a list of values from ri!directory for the key "name," which will be { "Maria", "Steven" }. The wherecontains() function will then check where "Maria" is found within this list. Since "Maria" is the first element, the function will return a list of indices where "Maria" is found, in this case, {1}. Appian lists are 1-indexed, so the first position is represented by 1, not 0.

NEW QUESTION # 79

You receive the following error message after creating a dropdown field:

What could be the problem?

- A. The choiceLabels and choiceValues datatypes do not match.
- B. The choiceLabels have too few labels.
- **C. The choiceValues has too few values.**

Answer: C

Explanation:

The error message indicates that the choiceValues array is not the same length as the choiceLabels array. In this scenario, there are more labels than values, which means the choiceValues array needs additional values to match the number of labels.

Appian Documentation: Dropdown Field

NEW QUESTION # 80

You need to add a new attribute to your database-backed synced Acme employee record. What should you do?

- A. In the record data model, you add the new field with ADD RELATIONSHIPS. Save the newly created relationship and use the field.
- B. In the record data model, you add the new field in the ADD SOURCE FIELDS. Save the field with the Update Table checkbox active.
- C. Add the new field manually to the ACME_Employee database table and run a database script to resync the Acme employee record.

Answer: C

NEW QUESTION # 81

You are using a local variable in an expression rule to describe the height of an applicant. Which statement correctly describes the application of Appian best practices for naming your local variable?

- A. local!applicantHeight - This employs the naming convention of specifically describing the value contained by the variable.
- B. local!x - This employs the naming convention of using algebraic variables for a value that may either change over time or be used by future developers for other purposes.
- C. local!hoaa - This employs the naming convention of abbreviating "Height of an applicant" to minimize both the typing required by developers and the length of code Appian is required to parse.

Answer: A

Explanation:

The best practice for naming variables in Appian is to use clear and descriptive names that convey the purpose or content of the variable. Therefore, local!applicantHeight is the best option as it precisely describes the value contained by the variable, which is the height of an applicant. This naming convention aids in readability and maintainability of the code, making it easier for developers to understand and modify the code in the future.
