In modern society, innovation is of great significance to the survival of a company. The new technology of the PDII study materials is developing so fast. So the competitiveness among companies about the study materials is fierce. Luckily, our company masters the core technology of developing the Platform Developer II study materials. No company in the field can surpass us. So we still hold the strong strength in the market. At present, our PDII study materials have applied for many patents. We attach great importance on the protection of our intellectual property. What is more, our research center has formed a group of professional experts responsible for researching new technology of the PDII Study Materials. The technology of the PDII study materials will be innovated every once in a while. As you can see, we never stop innovating new version of the PDII study materials. We really need your strong support.

To be eligible to take the Salesforce PDII exam, candidates must hold the Salesforce Certified Platform Developer I credential and have at least two years of experience developing custom applications on the Salesforce platform. PDII exam consists of 60 multiple-choice questions and has a time limit of 120 minutes. The passing score for the PDII exam is 65%.

The PDII Certification is highly valued in the Salesforce ecosystem as it demonstrates a high level of technical expertise and experience in developing complex applications on the Salesforce platform. It is also a prerequisite for some of the more advanced Salesforce certifications, such as the Salesforce Technical Architect certification.

Valid PDII Exam Experience - PDII Reliable Real Test

Desktop Salesforce PDII Practice Exam Software is a one-of-a-kind and very effective software developed to assist applicants in preparing for the Salesforce PDII certification test. The Desktop Salesforce PDII Practice Exam Software that we provide includes a self-assessment feature that enables you to test your knowledge by taking simulated tests and evaluating the results.

Salesforce PDII Certification is highly valued in the industry as it demonstrates the candidate's expertise in Salesforce development. It is a globally recognized certification that can help individuals advance their career in Salesforce development and increase their earning potential.

Salesforce Platform Developer II Sample Questions (Q142-Q147):

NEW QUESTION # 142

A developer creates a Lightning web component to allow a Contact to be quickly entered- However, error messages are not displayed.

Which component should the developer add to the form to display error messages?

- A. aura:messages
- B. apex:messages
- C. lightning-error
- D. lightning-messages

Answer: D

NEW QUESTION # 143

How can a developer efficiently incorporate multiple JavaScript libraries in an Aura component?

- A. Use CDNs with script attributes.
- B. Use JavaScript remoting and script tags.
- C. Implement the libraries in separate helper files.
- D. Join multiple assets from a static resource.

Answer: D

Explanation:

For incorporating multiple JavaScript libraries in Aura components, the best practice is to join multiple assets into a single static resource. This approach is efficient and avoids issues with asynchronous loading and potential conflicts between libraries.

NEW QUESTION # 144

A developer is building a complex commission calculation engine in Apex that is called from an Opportunity trigger. During QA it was reported that the calculations are incorrect. The developer has representative test data and passing test methods in their developer sandbox. Which three tools or techniques could the developer use to execute the code and pause it at key lines to visually inspect values of various Apex variables?

- A. Workbench
- B. Apex Interactive Debugger
- C. Developer Console
- D. Apex Replay Debugger
- E. Breakpoints

Answer: B,D,E

Explanation:

To perform traditional "step-through" debugging in Salesforce-where you can pause execution and inspect the state of variables in real-time or near-real-time-developers use the Salesforce extensions for VS Code.

The Apex Replay Debugger (Option B) is a free tool that allows developers to "replay" a transaction using a debug log. By setting Breakpoints (Option E) in their code and then executing the logic (or running a test), the developer can generate a log file. The Replay Debugger then parses this log, allowing the developer to step through the code line-by-line in VS Code as if it were happening live.^{1,2} The Apex Interactive Debugger (Option A) is a specialized tool (typically requiring a paid add-on for sandboxes) that allows for live, real-time debugging on a sandbox or scratch org. Unlike the Replay Debugger, it pauses the actual execution on the Salesforce server, giving the developer a live view of the environment. The Developer Console (Option D) and Workbench (Option C) provide log viewing and query capabilities, but they do not support the ability to "pause" execution at specific lines for visual inspection in the manner of a traditional IDE debugger. Therefore, the combination of a debugger tool and the use of breakpoints is the standard requirement for this debugging pattern.

NEW QUESTION # 145

A developer is debugging an Apex-based order creation process that has a requirement to have three savepoints, SP1, SP2, and SP3 (created in order), before the final execution of the process. During the final execution process, the developer has a routine to roll back to SP1 for a given condition. Once the condition is fixed, the code then calls a roll back to SP3 to continue with final execution. However, when the roll back to SP3 is called, a runtime error occurs. Why does the developer receive a runtime error?

- A. The developer used too many savepoints in one trigger session.
- **B. SP3 became invalid when SP1 was rolled back.**
- C. The developer has too many DML statements between the savepoints.
- D. The developer should have called SP2 before calling SP3.

Answer: B

Explanation:

67

Salesforce uses Database.Savepoint objects to manage transaction integrity, allowing developers to roll back the database state to a specific point in time without aborting the entire transaction. However, savepoints follow a strict "stack" logic.⁸ When you create savepoints in sequence (SP1, then SP2, then SP3), they exist in a linear timeline.^{9,10,11} When a developer executes a Database.rollback(SP1), the system reverts the database state to exactly how it was when SP1 was created. A critical side effect of this operation is that any savepoints created after the target savepoint are immediately destroyed and invalidated. Because SP3 was created after SP1,¹² rolling back to SP1 clears SP3 from the transaction's memory. Therefore, any subsequent attempt to call Database.

rollback(SP3) will result in a runtime error because SP3 no longer exists.

To fix this logic, once the code rolls back to SP1 and addresses the condition, it would need to proceed forward through the logic again and potentially set new savepoints if needed. You cannot "jump back forward" to a later savepoint once an earlier one has been invoked, as the rollback has effectively erased the timeline that led to the later savepoints. Understanding this linear invalidation is essential for managing complex nested transactions in Apex.

NEW QUESTION # 146

Universal Containers (LIC) wants to develop a customer community to help their customers log issues with their containers. The community needs to function for their German- and Spanish-speaking customers also.

UC heard that it's easy to create an international community using Salesforce, and hired a developer to build out the site.

What should the developer use to ensure the site is multilingual?

- A. Use custom objects to translate custom picklist values.
- B. Use custom metadata to translate custom picklist values.
- C. Use custom settings to ensure custom messages are translated properly.
- **D. Use custom labels to ensure custom messages are translated properly.**

Answer: D

Explanation:

Custom labels are used for translating text strings in Salesforce that need to be presented in multiple languages. They support translations and can be referenced in Aura components, Visualforce pages, and Apex code.
