

IdentityIQ-Associate Valid Exam Forum 100% Pass | Valid Exam IdentityIQ-Associate Question: SailPoint Certified IdentityIQ Associate Exam

What's more, part of that Actual4Labs IdentityIQ-Associate dumps now are free: https://drive.google.com/open?id=12mONH8W711Ydp3j6qqFciWmUcF6guA4_

Success in the SailPoint IdentityIQ-Associate Exam paves the way toward high-paying jobs, promotions, and skills verification. Hundreds of SailPoint IdentityIQ-Associate test takers don't get success because of using SailPoint outdated dumps. Due to failure, they lose money, time, and confidence. All these losses can be prevented by using updated and real SailPoint Dumps of Actual4Labs.

SailPoint IdentityIQ-Associate Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> Access Modeling: Covers how entitlements and roles are defined, cataloged, and assigned to identities within IdentityIQ.
Topic 2	<ul style="list-style-type: none"> Applications: Focuses on how applications and connectors are configured in IdentityIQ, including schemas, correlation, aggregation tasks, and resolving uncorrelated accounts.
Topic 3	<ul style="list-style-type: none"> Governance: Addresses how access certifications are conducted and how policy violations are defined and detected across the organization.
Topic 4	<ul style="list-style-type: none"> User-Driven Requests: Explains how users submit access requests, what request types are available, and how QuickLink Populations control who can request what for whom.
Topic 5	<ul style="list-style-type: none"> Identity Modeling: Explains how identity data is structured and managed through IdentityCubes, identity attributes, groups, populations, and manager correlation.

- Provisioning: Covers how IdentityIQ provisions access, including triggering actions, provisioning policies, Lifecycle Events, and attribute synchronization.

Pass Guaranteed SailPoint - Useful IdentityIQ-Associate - SailPoint Certified IdentityIQ Associate Exam Valid Exam Forum

We provide IdentityIQ-Associate Exam Torrent which are of high quality and can boost high passing rate and hit rate. Our passing rate is 99% and thus you can reassure yourself to buy our product and enjoy the benefits brought by our IdentityIQ-Associate exam materials. Our product is efficient and can help you master the SailPoint Certified IdentityIQ Associate Exam guide torrent in a short time and save your energy. The product we provide is compiled by experts and approved by the professionals who boost profound experiences.

SailPoint Certified IdentityIQ Associate Exam Sample Questions (Q14-Q19):

NEW QUESTION # 14

Is this an accurate statement about the selection of a connector as part of an application definition?

The connector's featureString specifies the particular capabilities of the connector, such as the connector's ability to write changes to the application.

- A. No
- B. Yes

Answer: B

Explanation:

Yes. In SailPoint IdentityIQ, connector selection determines not only how IdentityIQ communicates with the target application, but also which operations the connector is capable of supporting. The connector featureString identifies connector capabilities exposed to IdentityIQ. These capabilities can include whether the connector supports account aggregation, group aggregation, schema discovery, provisioning, password management, authentication, or other connector-specific functions.

This is important because IdentityIQ uses connector capabilities to determine which configuration options and operational behaviors are valid for the application. For example, a connector that supports provisioning can write account or entitlement changes back to the managed system through provisioning plans. A read-only connector, by contrast, may support aggregation but not allow IdentityIQ to create, modify, disable, or delete accounts on the target. Therefore, the featureString helps define whether the connector can perform write operations against the application.

The statement is accurate because the connector's advertised features directly describe functional capabilities, including the ability to write changes where supported. Reference topics: Applications, connector selection, application definition, connector-dependent settings, provisioning support, aggregation behavior, and connector capabilities.

NEW QUESTION # 15

Is this statement true for the use of tasks?

They can be used to confirm that the correct access is included in a role.

- A. Yes
- B. No

Answer: B

Explanation:

No. In SailPoint IdentityIQ, tasks are used to execute defined system operations, often as background or scheduled processes.

Common task usage includes account aggregation, identity refresh, entitlement aggregation, maintenance activities, report execution, role processing, and other repeatable administrative operations. A task may calculate, update, import, refresh, or process data, but it does not itself perform the governance decision of confirming whether access in a role is correct.

Confirming that the correct access is included in a role is a governance review function, most closely associated with role certification, especially role composition certification. In that process, a role owner or designated certifier reviews the access profiles,

entitlements, permissions, or requirements contained in a role and decides whether they are appropriate. The confirmation requires business judgment and reviewer action, not merely task execution.

A task may support role governance indirectly by refreshing role data or generating background processing, but the validation of role contents belongs to certifications and access governance. Therefore, this statement is not accurate for the use of tasks. Reference topics: Foundational Concepts, tasks versus workflows, Governance, role composition certification, Access Modeling, and role governance.

NEW QUESTION # 16

Is this statement accurate about the BeanShell rules used in the aggregation process?

The application's creation rule, if specified, will run when IdentityIQ is unable to correlate an account to an existing identity.

- A. No
- **B. Yes**

Answer: B

Explanation:

Yes. In SailPoint IdentityIQ aggregation, correlation is attempted first to match an aggregated account to an existing IdentityCube. Correlation may use configured attribute mappings, correlation rules, or other application correlation logic. If IdentityIQ cannot correlate the account to an existing identity, the application's creation rule, when configured, can be invoked to determine how IdentityIQ should handle identity creation for that uncorrelated account.

This is especially relevant for authoritative applications, where aggregated account records may represent people who should exist as identities in IdentityIQ. The creation rule can control identity creation behavior, populate required identity attributes, and apply implementation-specific logic when standard correlation does not find a match. Without appropriate creation behavior, the account may remain uncorrelated and require later remediation through corrected correlation logic, re-aggregation, or manual correlation. Therefore, the statement is accurate: the creation rule is associated with the aggregation and correlation process and is used when an account cannot be matched to an existing IdentityCube. Reference topics: Applications, BeanShell rules, account aggregation, correlation logic, identity creation rules, authoritative applications, and uncorrelated account handling.

NEW QUESTION # 17

Does this statement accurately describe how roles are acquired by users in the default role model configuration?

Business roles can only be requested by managers.

- A. Yes
- **B. No**

Answer: B

Explanation:

No. This statement does not accurately describe role acquisition in IdentityIQ. Business roles are not restricted to being requested only by managers. In IdentityIQ, roles may be acquired through role assignment logic, role detection, access requests, or administrative action, depending on the role configuration and the organization's request model.

A business role commonly represents access associated with a business function, job, department, location, or organizational responsibility. Users may receive business roles automatically when their identity attributes satisfy configured role profiles or assignment rules, typically recalculated during Identity Refresh. Separately, roles may be made requestable through Lifecycle Manager and exposed through QuickLinks, where request eligibility is controlled by QuickLink Populations, request configuration, and workflow rules.

Managers may be allowed to request roles for direct reports, but that is only one possible configuration.

IdentityIQ can also allow users to request roles for themselves, allow delegated requesters to request for others, or restrict requests to specific populations.

Therefore, "only requested by managers" is too narrow and incorrect. Reference topics: Access Modeling, business roles, role assignment, role detection, Identity Refresh, User-Driven Requests, QuickLink Populations, and role request configuration.

NEW QUESTION # 18

Is this an accurate statement about the Manage Accounts feature in LifeCycle Manager?

If users can request new accounts on an application, IdentityIQ also allows them to request an additional account on the application.

- A. Yes
- B. No

Answer: B

Explanation:

The statement is not accurate as written. In IdentityIQ LifeCycle Manager, allowing users to request a new account on an application does not automatically mean they can request an additional account on that same application. These are related but distinct account request scenarios. A new account request typically applies when an identity does not already have an account on the target application. An additional account request applies when an identity already has an account and the application is configured to support more than one account for the same identity.

Whether additional accounts are available depends on the application's account model, connector support, application configuration, request configuration, and provisioning policy behavior. Some applications support only one account per identity; in those cases, IdentityIQ may allow creation of the initial account but not allow a second or additional account. Manage Accounts can expose account lifecycle actions such as create, modify, enable, disable, unlock, delete, or request additional accounts, but only when the underlying application and IdentityIQ configuration support those operations.

Reference topics: User-Driven Requests - account request types and operations; Applications - connector and application settings; Provisioning - provisioning policies and account creation behavior.

NEW QUESTION # 19

.....

You may attend many certificate exams but you unfortunately always fail in or the certificates you get can't play the rules you want and help you a lot. So what certificate exam should you attend and what method should you use to let the certificate play its due role? You should choose the test IdentityIQ-Associate certification and buy our IdentityIQ-Associate study materials to solve the problem. Passing the test IdentityIQ-Associate certification can help you increase your wage and be promoted easily and buying our IdentityIQ-Associate study materials can help you pass the test smoothly.
