Besides, we also pass guarantee and money back guarantee if you fail to pass the exam exam.

SAP Certified Associate - Configuring SAP Ariba Strategic Sourcing Suite Sample Questions (Q40-Q45):

NEW QUESTION # 40

When you have created a new custom field and marked it as reportable, saved and published your changes, but the field does not show up in reports. How can you resolve the issue?

- A. Custom fields must be created in the same module where reports are generated.
- **B. Run the "Retrieve flexible fields metadata for reporting" task under Reporting Manager.**
- C. You did not assign the custom field to the appropriate report category.
- D. Wait 2 hours for the schema to refresh automatically.

Answer: B

Explanation:

After publishing a custom reportable field, the "Retrieve flexible fields metadata for reporting" task must be run to update the reporting schema with the new field metadata. Without this manual step, the reports do not recognize the new field despite it being published. The system does not perform automatic timed refreshes of the schema. Module location or report category assignment is not a prerequisite for report visibility in SAP Ariba's analytics.

NEW QUESTION # 41

You need to revise a published form template. What steps do you follow?

- A. Clone and change ID
- **B. Create a new version, edit, test, and publish**
- C. Delete and recreate
- D. Edit directly in production

Answer: B

Explanation:

SAP Ariba requires that revisions to published form templates be handled through creating a new version of the template, then editing and testing the draft version before publishing it. The system maintains the prior published version active while you work on the new draft, ensuring no disruption. Cloning and changing IDs is unnecessary and not best practice. Direct edits on published templates are not permitted, and deleting and recreating loses version history and control. This versioning mechanism supports safe, auditable template changes.

NEW QUESTION # 42

Which of the following considerations are important when creating custom fields? Note: There are 2 correct answers to this question.

- **A. When a field has been created and published, that field type has been consumed from the number of available fields on the class**
- B. The data type of a field can be dynamically changed, depending on data type availability
- C. Published field changes can be reverted via Un-publish to free up memory
- **D. There's a limit to the number of fields, by data type, that can be added to a class**

Answer: A,D

NEW QUESTION # 43

While working on editing a field for a customer, you notice that "Editable in full Contract Amendment" is not an option available in the advanced tab of field configuration. What is likely the cause for this behavior?

(Select 2 correct answers)

- A. The field you are customizing is standard and therefore cannot be changed.
- **B. The field you are customizing is not in the contract workspace or request classes.**
- **C. The contract must be in an amendment state for this option to be visible in customizing.**
- D. A customization is in flight and needs to be cleared and reset prior to making this change.

Answer: B,C

Explanation:

The "Editable in full Contract Amendment" option in SAP Ariba is available only when the contract is in an amendment status, meaning this option appears contextually when the contract supports amendment workflows. If the contract is not in amendment state, the option remains hidden (A).

Additionally, this option is only relevant for fields that belong to the Contract Workspace or Request field classes; fields outside these classes will not show amendment-specific editability options (C).

The presence or absence of this option is not related to ongoing customizations needing reset (B), nor is it restricted solely to custom or standard fields (D), as standard fields can also have this option if class-applicable.

NEW QUESTION # 44

Who leads Suite Integration activities?

- A. SAP Deployment Lead
- B. Partner/Customer Functional Lead
- C. Customer Success Manager
- D. SAP Support

Answer: A

Explanation:

The SAP Deployment Lead is responsible for leading Suite Integration activities across SAP Ariba solutions.

This role acts as the primary coordinator and facilitator for integration efforts, ensuring smooth data flow, process alignment, and technical synchronization between sourcing, procurement, contracts, and other modules in the Ariba suite. The Deployment Lead works closely with the customer's functional teams, partners, and technical specialists to manage integration scope, timelines, and troubleshooting.

SAP Support typically provides post-go-live assistance but does not lead integration planning. Functional leads focus on configuration and business processes but lack overarching integration responsibility. Customer Success Managers focus on adoption and satisfaction rather than technical integration.

Therefore, the Deployment Lead role is critical for coordinating complex multi-solution projects and ensuring a unified suite experience.

NEW QUESTION # 45

.....
