EMC Dell Information Storage and Management Foundations v2 Exam Sample Questions (Q10-Q15):

NEW QUESTION # 10
Question:
In traditional provisioning, which two factors determine the availability, capacity, and performance of the RAID set?

- A. The number of drives in the RAID set
- B. Capacity of drives
- C. The RAID level
- D. Make of drives

Answer: A,C

Explanation:
In traditional storage provisioning, the RAID configuration significantly impacts the storage system's characteristics:
* RAID Level: Determines data redundancy and fault tolerance. For example, RAID 1 mirrors data, providing high availability, while RAID 5 uses parity, balancing performance and redundancy.
* Number of Drives: Affects both capacity and performance. More drives can increase total storage capacity and improve performance through parallel data access.
* Make of Drives: While drive quality matters, it's less influential than RAID configuration in determining overall system characteristics.
* Capacity of Drives: Impacts total storage size but doesn't directly influence performance or availability as significantly as RAID level and drive count.

NEW QUESTION # 11
Question:
What is an advantage of deploying intelligent storage systems in the data center?

- A. Migrates data from a data center to the cloud at no cost
- B. Reduces the complexity of managing information by creating silos of storage
- C. Reduces the amount of data to replicate, migrate, and back up
- D. Enables efficient and optimized storage and management of information

Answer: D

Explanation:
Intelligent storage systems incorporate advanced features like automated tiering, deduplication, and compression. These features enable efficient storage utilization and optimized management by automating data placement and reducing manual intervention.
* Option A: While intelligent systems may facilitate cloud integration, they do not guarantee cost-free migration.
* Option B: Data reduction features help, but the primary advantage is broader efficiency and optimization.
* Option C: Creating silos increases complexity; intelligent systems aim to unify and simplify storage management.

NEW QUESTION # 12
Question:
What is the first step in a machine learning process?

- A. Selecting the type of learning
- B. Collecting the datasets
- C. Analyzing the data
- D. Training the model

Answer: B

Explanation:
Collecting the datasetsis the first step in any machine learning (ML) process. Without data, the ML system cannot function. Steps include:
1##Collecting datasets:Gathering data relevant to the problem to train and validate the ML model.
2##Analyzing data:Cleaning and exploring data for patterns.
3##Selecting learning type:Deciding between supervised, unsupervised, or reinforcement learning.
4##Training the model:Using the data to build predictive models.

NEW QUESTION # 13
Question:
What is the function of a continuous data protection (CDP) appliance?

- A. Migrates deduplicated data from the source volume to the target volume during replication

- B. Stores all data that has changed from the time the replication session started
- C. Intercepts writes to the production volume and splits each write into two copies
- D. Runs data protection software and manages replications within and across data centers

Answer: C

Explanation:
ACDP appliancesits in the data path and:
Intercepts all writesto the production volume.
Splits each write into two copies: one goes to the production volume, the other to the replica volume.
Maintains a journal for point-in-time recovery.
* Option A/B/C: These are aspects of replication, but CDP's primary function is real-time interception and splitting of writes.
Reference:Dell Information Storage and Management Foundations 2023 Study Guide, Section: Continuous Data Protection Technologies.

NEW QUESTION # 14
Question:
Which two interfaces does an OSD (Object Storage Device) gateway typically present to applications?

- A. File-based interfaces like NFS and CIFS
- B. SSH and SMB
- C. REST and SOAP APIs
- D. HTTP and HTTPS

Answer: C

Explanation:
OSD gateways provide access to object storage systems through APIs. The most common interfaces are:
* REST (Representational State Transfer): A stateless protocol using standard HTTP methods, widely used for web services.
* SOAP (Simple Object Access Protocol): A protocol for exchanging structured information in web services, using XML.
These APIs allow applications to interact with object storage systems over HTTP/HTTPS protocols.
* SSH and SMB: SSH is for secure shell access; SMB is for file sharing, not typically used for object storage.
* HTTP and HTTPS: These are transport protocols; while used by REST and SOAP, they are not interfaces themselves.
* NFS and CIFS: File-based interfaces, not used for object storage.
