最新的 Salesforce Developer AP-202 免費考試真題 (Q171-Q176):

問題 #171

How are variables bound when services use the ccServiceDao classto execute queries?

- A. Apex local variables
- B. Apex class variables
- C. Global variables
- D. String substitution

答案: D

解題說明:

When services use the ccServiceDao class to execute queries, variables are bound by string substitution. This means that the query string contains placeholders for variables that are replaced by their values at runtime. For example,ccrz.ccServiceDao.getQuery('SELECT Id FROM Account WHERE Name = :name')will eplace:namewith he value of thenameariale.

問題 #172

Which orders can a user view on Order List Component (Aura) for B2B stores?

- A. Orders placed in any storefront and related to the current user's account
- B. Orders placed in any storefront and related to the current effective account
- **C. Orders placed in the current storefront and related to the current effective account**
- D. Orders placed in the current storefront and related to the current user's account

答案: C

解題說明:

According to the B2B Commerce Developer Guide, the Order List Component (Aura) for B2B stores displays a list of orders that the user can view and reorder. The component filters the orders based on the current storefront and the current effective account. The current effective account is the account that the user is currently acting on behalf of, which can be different from the user's own account. The component does not show orders placed in other storefronts or related to other accounts, even if the user has access to them. Therefore, the correct answer is A. Orders placed in the current storefront and related to the current effective account. The other options are incorrect because they do not match the criteria of the component. 問題 #173

Which three files are required for a deployable Lightning Web Component called displayMyData that will fetch and display data?

- A. displayMyDataController.cls
- B. displayMyData.js
- **C. displayMyData.html**
- **D. displayMyData.js-meta.xml**
- **E. displayMyData.css**

答案: C,D,E

解題說明:

For a deployable Lightning Web Component like displayMyData, the required files include the component's CSS file (displayMyData.css) for styling, the metadata configuration file (displayMyData.js-meta.xml) for defining the component's configuration and properties, and the template file (displayMyData.html) for the component's HTML structure. The JavaScript file (displayMyData.js) contains the business logic but is not listed as an option here. For deployment, these files are essential. Refer to the Salesforce LWC documentation for deployment requirements: Salesforce LWC Deployment Documentation.

問題 #174

Which two methods should a developer implement in a Lightning web component to successfully handle the subscription lifecycle of a Message Channel?

- **A. Subscribe()**
- B. startListener()
- C. stopListener()
- **D. unsubscribe()**

答案: A,D

解題說明:

To handle the subscription lifecycle of a message channel in a Lightning web component, the developer should implement the subscribe() and unsubscribe() methods from the lightning/messageService module. The subscribe() method returns a subscription object that represents the connection to the message channel. The developer can use this object to unsubscribe from the message channel later. The unsubscribe() method takes a subscription object as a parameter and removes the listener from the message channel. The developer should call the unsubscribe() method when the component is disconnected from the DOM, such as in the disconnectedCallback() lifecycle hook, to avoid memory leaks and performance issues.

The other options are not correct because:

B) stopListener() is not a valid method for handling the subscription lifecycle of a message channel. There is no such method in the lightning/messageService module or the Lightning web component framework.

C) startListener() is not a valid method for handling the subscription lifecycle of a message channel. There is no such method in

the lightning/messageService module or the Lightning web component framework.

問題 #175

Which category can receive signaling from a Lightning Message Channel?

- A. only descendants (i.e. children)
- **B. page (anywhere on it)**
- C. only direct siblings
- D. only ancestors (i.e. parents)

答案: B

解題說明:

A Lightning Message Channel can receive signaling from any component on a page (anywhere on it). A Lightning Message Channel is a service that allows components to communicate with each other across different Salesforce UI technologies, such as Aura, LWC, Visualforce, and Lightning web apps. A component can subscribe to a message channel and receive events that are published by another component on the same or different page. The message channel acts as a mediator that delivers the events to the subscribers. A Lightning Message Channel does not receive signaling only from descendants (i.e., children), only from direct siblings, or only from ancestors (i.e., parents), as these are limitations of event-based communication.
