HP HPE7-A02 Reliable Test Syllabus - New HPE7-A02 Test Discount

Our HPE7-A02 training materials offer you everything you need to take the certification and face the challenge of professional knowledge points. The HPE7-A02 exam dumps are written and approved by our IT specialist based on the real questions of the formal test. Our latest learning materials contain the valid test questions and correct HPE7-A02 Test Answers along with detailed explanation. We will give your money back in full if you lose exam with our HPE7-A02 practice exam.

HP Aruba Certified Network Security Professional Exam Sample Questions (Q101-Q106):

NEW QUESTION # 101

HPE Aruba Networking ClearPass Policy Manager (CPPM) uses a service to authenticate clients. You are now adding the

Endpoints Repository as an authorization source for the service, and you want to add rules to the service's policies that apply different access levels based, in part, on a client's device category. You need to ensure that CPPM can apply the new correct access level after discovering new clients' categories.

What should you enable on the service?

- A. The Posture Compliance option in the Service tab
- B. The Audit End-host option in the Service tab
- **C. The Profile Endpoints option in the Service tab**
- D. The Use cached Roles and Posture attributes from previous sessions option in the Enforcement tab

Answer: C

Explanation:

To ensure that HPE Aruba Networking ClearPass Policy Manager (CPPM) can apply the correct access levels based on a client's device category after discovering new clients, you need to enable the "Profile Endpoints" option in the Service tab. This option allows CPPM to profile and categorize endpoints dynamically, ensuring that the appropriate access levels are applied based on the device's characteristics.

Enabling this feature ensures that new devices are accurately profiled and that access policies can be enforced based on the updated device information.

NEW QUESTION # 102

A company uses HPE Aruba Networking ClearPass Device Insight (CPDI) (the standalone application option). In the details for a generic device cluster, you see a recommendation for "Windows 8/10" with 70% accuracy.

What does this mean?

- A. CPDI has used MAC OUI to group these devices together. The average device's MAC address matches 70% of the "Windows 8/10" OUI.
- B. CPDI has grouped this cluster with similar classified devices. 70% of those classified devices are "Windows 8/10."
- C. CPDI has matched these devices against several, conflicting system rules. 70% of those rules are for "Windows 8/10" devices.
- **D. CPDI has detected that these devices match about 70% of the system rule for defining "Windows 8/10" devices.**

Answer: D

Explanation:

When HPE Aruba Networking ClearPass Device Insight (CPDI) shows a recommendation for "Windows 8/10" with 70% accuracy for a generic device cluster, it means that CPDI has detected that these devices match about 70% of the system rule criteria for defining "Windows 8/10" devices. This percentage indicates the confidence level based on the observed characteristics and behavior of the devices, helping administrators understand the likelihood that these devices are indeed running Windows 8 or 10.

NEW QUESTION # 103

HPE Aruba Networking ClearPass Policy Manager (CPPM) uses a service to authenticate clients. You are now adding the Endpoints Repository as an authorization source for the service, and you want to add rules to the service's policies that apply different access levels based, in part, on a client's device category. You need to ensure that CPPM can apply the new correct access level after discovering new clients' categories.

What should you enable on the service?

- A. The Posture Compliance option in the Service tab
- B. The Audit End-host option in the Service tab
- **C. The Profile Endpoints option in the Service tab**
- D. The Use cached Roles and Posture attributes from previous sessions option in the Enforcement tab

Answer: C

Explanation:

To ensure that HPE Aruba Networking ClearPass Policy Manager (CPPM) can apply the correct access levels based on a client's device category after discovering new clients, you need to enable the "Profile Endpoints" option in the Service tab. This option

allows CPPM to profile and categorize endpoints dynamically, ensuring that the appropriate access levels are applied based on the device's characteristics. Enabling this feature ensures that new devices are accurately profiled and that access policies can be enforced based on the updated device information.

Reference: Aruba ClearPass documentation and profiling guides detail the configuration and use of endpoint profiling to enhance access control and policy enforcement based on device categories.

NEW QUESTION # 104

The security team needs you to show them information about MAC spoofing attempts detected by HPE Aruba Networking ClearPass Policy Manager (CPPM).

What should you do?

- A. Export the Access Tracker records on CPPM as an XML file.
- B. Show the security team the CPPM Endpoint Profiler dashboard.
- **C. Use ClearPass Insight to run an Active Endpoint Security report.**
- D. Integrate CPPM with ClearPass Device Insight (CPDI) and run a security report on CPDI.

Answer: C

Explanation:

To show the security team information about MAC spoofing attempts detected by HPE Aruba Networking ClearPass Policy Manager (CPPM), you should use ClearPass Insight to run an Active Endpoint Security report. ClearPass Insight provides comprehensive reporting capabilities that include detailed information on security incidents, such as MAC spoofing attempts. By generating this report, you can provide the security team with a clear overview of the detected spoofing activities, including the endpoints involved and the context of the events.

Reference: The ClearPass documentation and Insight reporting guide offer detailed instructions on generating and interpreting Active Endpoint Security reports, which include data on MAC spoofing and other security incidents.

NEW QUESTION # 105

A company has HPE Aruba Networking APs running AOS-10 and managed by HPE Aruba Networking Central. The company also has AOS-CX switches. The security team wants you to capture traffic from a particular wireless client. You should capture this client's traffic over a 15-minute time period and then send the traffic to them in a PCAP file. What should you do?

- A. Access the CLI for the client's AP's switch. Set up a mirroring session between the AP's port and a management station running Wireshark.
- B. Go to that client in HPE Aruba Networking Central. Use the "Live Events" page to run a packet capture.
- **C. Go to the client's AP in HPE Aruba Networking Central. Use the "Security" page to run a packet capture.**
- D. Access the CLI for the client's AP. Set up a mirroring session between its radio and a management station running Wireshark.

Answer: C

Explanation:

* Packet Capture in Aruba Central:

* Aruba Central provides tools for remote packet captures directly from the APs.

* On the "Security" page for the AP, you can initiate a packet capture session, specifying the client device and capture duration.

* The traffic is captured into a PCAP file, which can be downloaded and analyzed using tools like Wireshark.

* Option Analysis:

* Option A: Incorrect. While possible via CLI, Aruba Central provides a simpler method for packet captures.

* Option B: Correct. Aruba Central's "Security" page allows you to capture and export client traffic efficiently.

* Option C: Incorrect. The "Live Events" page focuses on monitoring events, not packet captures.

* Option D: Incorrect. Port mirroring on the switch captures AP traffic but requires more manual configuration and does not isolate client-specific wireless traffic easily.

NEW QUESTION # 106
