ISACA Certified Cybersecurity Operations Analyst Sample Questions (Q92-Q97):

NEW QUESTION # 92

Which of the following is the MOST effective way to obtain business owner approval of cybersecurity initiatives across an organisation?

- **A. Create a steering committee.**
- B. Conduct an Internal audit.
- C. Generate progress reports.
- D. Provide data classifications.

Answer: A

Explanation:

The most effective way to obtain business owner approval for cybersecurity initiatives is to create a steering committee that includes key stakeholders from different departments. This approach works because:

- * **Inclusive Decision-Making:** Involving business owners in a structured committee fosters collaboration and buy-in.
- * **Alignment with Business Goals:** A steering committee ensures that cybersecurity initiatives align with the organization's strategic objectives.
- * **Regular Communication:** Provides a formal platform to present cybersecurity challenges, proposed solutions, and progress updates.
- * **Informed Decisions:** Business owners are more likely to support initiatives when they understand the risks and benefits.
- * **Consensus Building:** A committee fosters a sense of ownership and shared responsibility for cybersecurity.

Other options analysis:

- * **A. Provide data classifications:** While useful for identifying data sensitivity, this alone does not directly gain approval.
- * **C. Generate progress reports:** These are informative but lack the strategic collaboration needed for decision-making.
- * **D. Conduct an Internal audit:** Helps assess current security posture but does not engage business owners proactively.

CCOA Official Review Manual, 1st Edition References:

- * Chapter 2: Governance and Management: Discusses forming committees for cross-functional decision-making.
- * Chapter 5: Risk Management Strategies: Emphasizes stakeholder engagement through structured groups.

NEW QUESTION # 93

Which of the following risks is MOST relevant to cloud auto-scaling?

- A. Loss of integrity
- **B. Unforeseen expenses**
- C. Loss of confidentiality
- D. Data breaches

Answer: B

Explanation:

One of the most relevant risks associated with cloud auto-scaling is unforeseen expenses:

- * **Dynamic Resource Allocation:** Auto-scaling automatically adds resources based on demand, which can increase costs unexpectedly.
- * **Billing Surprises:** Without proper monitoring, auto-scaling can significantly inflate cloud bills, especially during traffic spikes.
- * **Mitigation:** Implementing budget controls and alerts helps manage costs.
- * **Financial Risk:** Organizations may face budget overruns if auto-scaling configurations are not properly optimized.

Incorrect Options:

- * **A. Loss of confidentiality:** Not directly related to auto-scaling.
- * **B. Loss of integrity:** Auto-scaling does not inherently affect data integrity.
- * **C. Data breaches:** More related to security misconfigurations rather than scaling issues.

Exact Extract from CCOA Official Review Manual, 1st Edition:

Refer to Chapter 3, Section "Cloud Security Challenges," Subsection "Cost Management in Auto-Scaling" - Uncontrolled auto-scaling can lead to significant and unexpected financial impact.

NEW QUESTION # 94

Which of the following MOST effectively minimizes the impact of a control failure?

- A. Information security policy
- B. Business impact analysis (BIA)
- **C. Defense in depth**
- D. Business continuity plan [BCP]

Answer: C

Explanation:

The most effective way to minimize the impact of a control failure is to employ Defense in Depth, which involves:

- * Layered Security Controls: Implementing multiple, overlapping security measures to protect assets.
- * Redundancy: If one control fails (e.g., a firewall), others (like IDS, endpoint protection, and network monitoring) continue to provide protection.
- * Minimizing Single Points of Failure: By diversifying security measures, no single failure will compromise the entire system.
- * Adaptive Security Posture: Layered defenses allow quick adjustments and contain threats.

Other options analysis:

- * A. Business continuity plan (BCP): Focuses on maintaining operations after an incident, not directly on minimizing control failures.
- * B. Business impact analysis (BIA): Identifies potential impacts but does not reduce failure impact directly.
- * D. Information security policy: Guides security practices but does not provide practical mitigation during a failure.

CCOA Official Review Manual, 1st Edition References:

- * Chapter 7: Defense in Depth Strategies: Emphasizes the importance of layering controls to reduce failure impacts.
- * Chapter 9: Incident Response and Mitigation: Explains how defense in depth supports resilience.

NEW QUESTION # 95

Which type of middleware is used for connecting software components that are written in different programming languages?

- A. Message-oriented middleware
- B. Remote procedure call middleware
- **C. Object-oriented middleware**
- D. Transaction processing middleware

Answer: C

Explanation:

Object-oriented middleware is used to connect software components written in different programming languages by:

- * Language Interoperability: Enables objects created in one language to be used in another, typically through CORBA (Common Object Request Broker Architecture) or DCOM (Distributed Component Object Model).
- * Distributed Systems: Facilitates communication between objects over a network.
- * Platform Independence: Abstracts the underlying communication protocols.
- * Example Use Case: A Java application calling methods on a C++ object using CORBA.

Other options analysis:

- * A. Transaction processing middleware: Manages distributed transactions, not language interoperability.
- * B. Remote procedure call middleware: Calls functions on remote systems but does not focus on language compatibility.
- * C. Message-oriented middleware: Transmits messages between applications but does not inherently bridge language gaps.

CCOA Official Review Manual, 1st Edition References:

- * Chapter 9: Middleware Technologies: Discusses various types of middleware and their roles.
- * Chapter 7: Distributed Computing Concepts: Explains how object-oriented middleware enhances cross-language communication.

NEW QUESTION # 96

An organization was breached via a web application attack to a database in which user inputs were not validated. This can BEST be described as which type of attack?

- A. X-Path
- **B. Broken access control**
- C. Infection
- D. Buffer overflow

Answer: B

Explanation:

The described scenario indicates an injection (i) attack, where the attacker exploits insufficient input validation in a web application to manipulate queries. This type of attack falls under the category of Broken Access Control because:

- * Improper Input Handling: The application fails to properly sanitize or validate user inputs, allowing malicious commands to execute.
- * Direct Database Manipulation: Attackers can bypass normal authentication or gain elevated access by injecting code.
- * OWASP Top Ten 2021: Lists Broken Access Control as a critical risk, often leading to data breaches when input validation is

weak.

Other options analysis:

- * B. Infection: Typically involves malware, which is not relevant here.
- * C. Buffer overflow: Involves memory management errors, not manipulation.
- * D. X-Path: Involves XML query manipulation, not databases.

CCOA Official Review Manual, 1st Edition References:

- * Chapter 4: Web Application Security: Discusses Injection as a common form of broken access control.
- * Chapter 9: Secure Coding and Development: Stresses the importance of input validation to prevent i.
