By our three versions of 156-836 study engine: the PDF, Software and APP online, we have many repeat orders in a long run. The PDF version helps you read content easier at your process of studying with clear arrangement, and the PC Test Engine version of 156-836 Practice Questions allows you to take stimulation exam to check your process of exam preparing, which support windows system only. Moreover, there is the APP version of 156-836 study engine, you can learn anywhere at any time.

The APP version of our 156-836 study guide provides you with mock exams, time-limited exams, and online error correction and let you can review on any electronic device. So that you can practice our 156-836 exam questions on Phone or IPAD, computer as so on. At the same time, for any version, we do not limit the number of downloads and the number of concurrent users, you can even buy 156-836 Learning Materials together with your friends, which undoubtedly saves you a lot of overhead.

## High Pass-Rate 156-836 Book Free Offer You The Best Exam Fees | Check Point Certified Maestro Expert - R81 (CCME)

With our CheckPoint 156-836 study materials, you can make full use of those time originally spent in waiting for the delivery of exam files so that you can get preparations as early as possible. There is why our CheckPoint 156-836 learning prep exam is well received by the general public.

### CheckPoint Check Point Certified Maestro Expert - R81 (CCME) Sample Questions (Q17-Q22):

#### NEW QUESTION # 17

What is the Correction Layer?

- A. Correction Layer is a Layer of GAIA OS which corrects misspelled commands and allows them to execute
- B. Correction Layer is a daemon which corrects errors on Backplane interfaces
- C. Correction Layer is a mechanism which activated in case of asymmetric routing
- **D. Correction Layer is a mechanism which handles asymmetric connections in multi-appliance system. For example, in case of NAT**

**Answer: D**

Explanation:

Explanation

The Correction Layer is a Maestro component that ensures that packets from the same connection are handled by the same Security Group Module (SGM) in a multi-appliance system. This is especially important when NAT is involved, as packets sent from the client to the server can be distributed to a different SGM than packets from the same session sent from the server to the client. The Correction Layer must then forward the packet to the correct SGM.

### NEW QUESTION # 18

What cannot be a reason for "Failed to get remote orchestrator interfaces" error message, when clicking on "Orchestrator" in WebUI

- A. Remote orchestrator has no empty interfaces
- B. Single orchestrator environment, but configured Orchestrator amount is 2
- C. No Sync between orchestrators
- D. One orchestrator only, but Orchestrator amount is 2 or no Sync in between orchestrators

**Answer: A**

Explanation:

One of the possible reasons for the "Failed to get remote orchestrator interfaces" error message, when clicking on "Orchestrator" in WebUI, is that the remote orchestrator has no empty interfaces that can be assigned to a security group. This can happen if all the interfaces on the remote orchestrator are already part of configured security groups, or if the remote orchestrator has no physical interfaces at all. In this case, the WebUI cannot display the unassigned interfaces of the remote orchestrator, and shows the error message.

### NEW QUESTION # 19

What does asg monitor command do?

- A. Show real-time cluster status of Appliances in Security Group
- B. This command does not exist
- C. Monitor traffic on Appliances in Security Group
- D. Monitor health status of entire system

**Answer: A**

Explanation:

The "asg monitor" command generally would show real-time cluster status of appliances in a security group, focusing on health and operational status.

### NEW QUESTION # 20

There are two appliances within the same Security Group. One of them is connected by One downlink only, another one by Two downlinks. Assuming there's no NAT and no VPN, what would be proportion of traffic distribution done by Orchestrator?

- A. 50%/50%
- B. 33%/66%
- C. 66%/33%
- D. 100%/0%

**Answer: A**

Explanation:

Explanation

The proportion of traffic distribution done by Orchestrator depends on the traffic distribution mode that is configured for the Security Group. There are three modes: Round Robin, Load Sharing, and Active/Standby1.

\*Round Robin mode distributes the traffic equally among all the appliances in the Security Group, regardless of the number of downlinks they have. This mode is suitable for scenarios where all the appliances have similar performance and capacity. In this mode, the proportion of traffic distribution would be 50%/50% for two appliances with one and two downlinks respectively.

\*Load Sharing mode distributes the traffic proportionally to the number of downlinks each appliance has. This mode is suitable for

scenarios where the appliances have different performance and capacity. In this mode, the proportion of traffic distribution would be 33%/66% for two appliances with one and two downlinks respectively.

\*Active/Standby mode distributes the traffic to only one appliance at a time, while the other appliances are in standby mode. This mode is suitable for scenarios where high availability is required. In this mode, the proportion of traffic distribution would be 100%/0% or 0%/100% for two appliances with one and two downlinks respectively, depending on which appliance is active. Since the question does not specify the traffic distribution mode, the default mode is Round Robin2.

Therefore, the proportion of traffic distribution would be 50%/50% for two appliances with one and two downlinks respectively.

#### NEW QUESTION # 21

What is the default Distribution mode?

- A. User
- B. Manual-General
- C. Auto-topology
- D. Network

**Answer: C**

Explanation:

Auto-topology is the default distribution mode for Maestro Security Groups. In this mode, the Orchestrator assigns packets to a Security Group Member based on the topology of the port defined in the gateway object.

Each port is either in user mode or network mode depending on the topology. User mode means that the port is connected to the internal network and network mode means that the port is connected to the external network. The Orchestrator uses a hash function to map each source IP or destination IP to a specific SGM, depending on the mode of the port. This mode ensures that all packets with the same source IP or destination IP are processed by the same SGM, regardless of the port or protocol.
