## Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q250-Q255):

### NEW QUESTION # 250

A company is developing a file-sharing application that will use an Amazon S3 bucket for storage. The company wants to serve all the files through an Amazon CloudFront distribution. The company does not want the files to be accessible through direct navigation to the S3 URL.

What should a solutions architect do to meet these requirements?

- A. Write an S3 bucket policy that assigns the CloudFront distribution ID as the Principal and assigns the target S3 bucket as the Amazon Resource Name (ARN).
- B. Create an IAM user. Grant the user read permission to objects in the S3 bucket. Assign the user to CloudFront.
- C. Write individual policies for each S3 bucket to grant read permission for only CloudFront access.
- **D. Create an origin access identity (OAI). Assign the OAI to the CloudFront distribution. Configure the S3 bucket permissions so that only the OAI has read permission.**

**Answer: D**

#### NEW QUESTION # 251

What is the maximum key length of a tag?

- A. 512 Unicode characters
- B. 256 Unicode characters
- C. 64 Unicode characters
- **D. 128 Unicode characters**

**Answer: D**

#### NEW QUESTION # 252

A corporate web application is deployed within an Amazon Virtual Private Cloud (VPC) and is connected to the corporate data center via an IPsec VPN. The application must authenticate against the on-premises LDAP server. After authentication, each logged-in user can only access an Amazon Simple Storage Space (S3) key space specific to that user.

Which two approaches can satisfy these objectives? (Choose 2 answers)

- A. The application authenticates against IAM Security Token Service using the LDAP credentials the application uses those temporary AWS security credentials to access the appropriate S3 bucket.
- B. The application authenticates against LDAP the application then calls the AWS identity and Access Management (IAM) Security service to log in to IAM using the LDAP credentials the application can use the IAM temporary credentials to access the appropriate S3 bucket.
- C. Develop an identity broker that authenticates against IAM security Token service to assume a IAM role in order to get temporary AWS security credentials The application calls the identity broker to get AWS temporary security credentials with access to the appropriate S3 bucket.
- **D. The application authenticates against LDAP and retrieves the name of an IAM role associated with the user. The application then calls the IAM Security Token Service to assume that IAM role The application can use the temporary credentials to access the appropriate S3 bucket.**
- **E. Develop an identity broker that authenticates against LDAP and then calls IAM Security Token Service to get IAM federated user credentials The application calls the identity broker to get IAM federated user credentials with access to the appropriate S3 bucket.**

**Answer: D,E**

#### NEW QUESTION # 253

Select the correct statement: Within Amazon EC2, when using Linux instances, the device name /dev/sda1 is \_\_\_\_\_.

- A. recommended for instance store volumes
- **B. reserved for the root device**
- C. recommended for EBS volumes
- D. reserved for EBS volumes

**Answer: B**

Explanation:

Within Amazon EC2, when using a Linux instance, the device name /dev/sda1 is reserved for the root device.

### NEW QUESTION # 254

A company operates multiple VPCs in a single AWS account. Account users need temporary access to Amazon S3 buckets. The S3 buckets are private and have no public endpoints.

The solution must follow the principle of least privilege for access to each environment and must avoid distributing permanent access keys.

Which solution will meet these requirements?

- A. Route S3 traffic through a NAT gateway. Configure bucket policies that allow traffic only from the NAT gateway's public IP addresses.
- **B. Create a gateway VPC endpoint for Amazon S3 in each VPC. Attach an endpoint policy that allows only environment-scoped IAM roles to access the S3 buckets.**
- C. Configure the S3 buckets to use SSE-S3. Create bucket policies that allow access only from the VPC CIDR blocks.
- D. Define separate S3 access points for each environment. Allow users to assume a role associated with the access points. Use the default Amazon S3 endpoints.

**Answer: B**

Explanation:

AWS documentation states that the most secure method for granting private S3 access from VPCs is to use gateway VPC endpoints for Amazon S3. Endpoint policies enforce least privilege by allowing only specific IAM roles access to specific S3 buckets. Because users can obtain temporary credentials through IAM roles, no permanent access keys must be distributed. S3 bucket policies based on CIDR ranges (Option B) are less secure because CIDR-based access is broader and can grant unintended access. Access points (Option C) still rely on public S3 endpoints unless combined with VPC-only access, which is not stated here. Option D exposes S3 to public internet egress and depends on public IPs, violating least-privilege principles.
