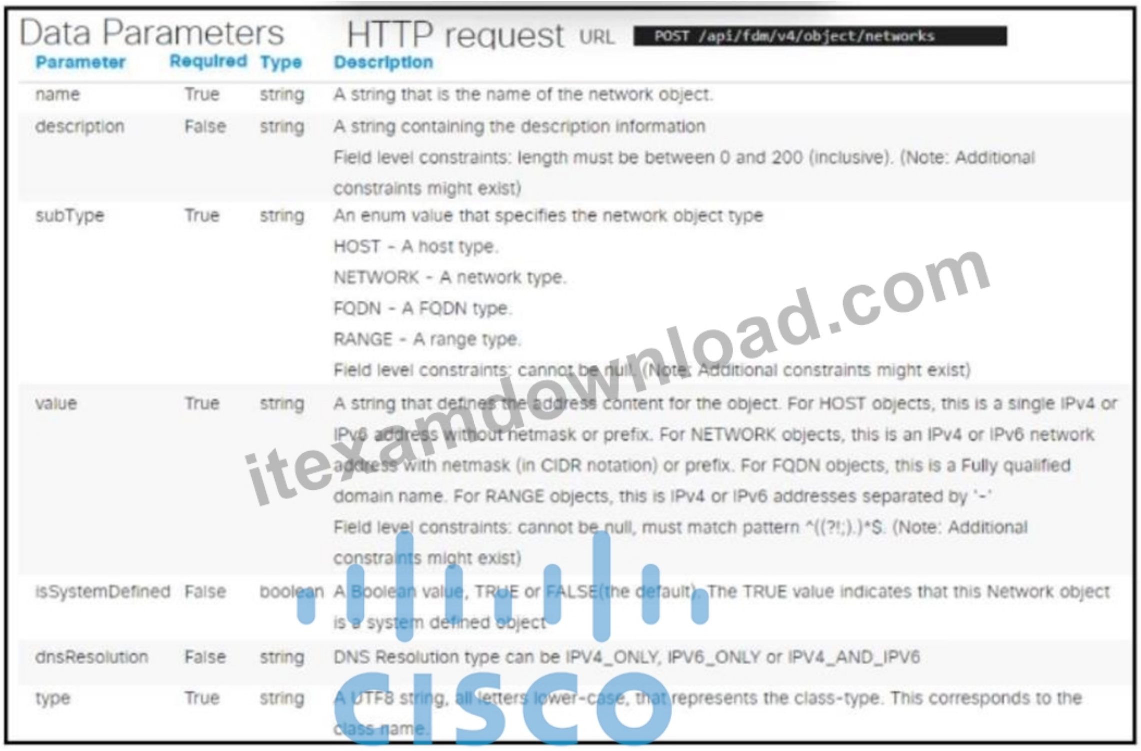
Cisco Developing Applications using Cisco Core Platforms and APIs (DEVCOR) Sample Questions (Q89-Q94):

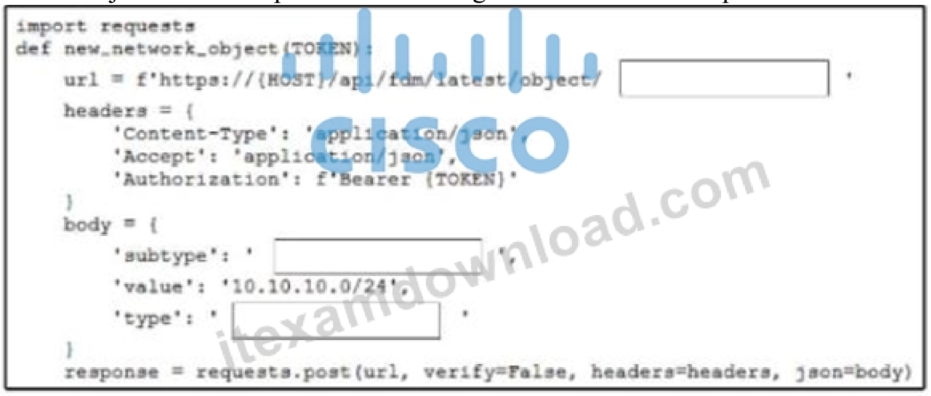
NEW QUESTION # 89
Refer to the exhibit.



Data Parameters　HTTP request URL `POST /api/fdm/v4/object/networks`

Parameter	Required	Type	Description
name	True	string	A string that is the name of the network object.
description	False	string	A string containing the description information Field level constraints: length must be between 0 and 200 (inclusive). (Note: Additional constraints might exist)
subType	True	string	An enum value that specifies the network object type HOST - A host type. NETWORK - A network type. FQDN - A FQDN type. RANGE - A range type. Field level constraints: cannot be null. (Note: Additional constraints might exist)
value	True	string	A string that defines the address content for the object. For HOST objects, this is a single IPv4 or IPv6 address without netmask or prefix. For NETWORK objects, this is an IPv4 or IPv6 network address with netmask (in CIDR notation) or prefix. For FQDN objects, this is a Fully qualified domain name. For RANGE objects, this is IPv4 or IPv6 addresses separated by '-' Field level constraints: cannot be null, must match pattern ^((?!;).)*$. (Note: Additional constraints might exist)
isSystemDefined	False	boolean	A Boolean value, TRUE or FALSE(the default). The TRUE value indicates that this Network object is a system defined object
dnsResolution	False	string	DNS Resolution type can be IPV4_ONLY, IPV6_ONLY or IPV4_AND_IPV6
type	True	string	A UTF8 string, all letters lower-case, that represents the class-type. This corresponds to the class name.

Refer to the exhibit. Drag and drop the code snippets from the bottom onto the blanks in the code to create a function to add new network objects to their Firepower Device Management instance. Not all options are used.



```
import requests
def new_network_object(TOKEN):
    url = f'https://{HOST}/api/fdm/latest/object/[          ]'

1.5 Getting Started

1.5.1 Connecting Disconnecting

```
from ucsmsdk.ucshandle import UcsHandle

# Create a connection handle
handle = UcsHandle("192.168.1.1", "admin", "password")

# Login to the server
handle.login()

# Logout from the server
handle.logout()
```

Refer UcsHandle API Reference for detailed parameter sets to `UcsHandle`

1.5.2 Base APIs

The SDK provides APIs to enable CRUD operations.

- Create an object - add_mo
- Retrieve an object - query_dn,query_classid,query_dns,query_classids
- Update an object - set_mo
- Delete an object - delete_mo

The above APIs can be bunched together in a transaction (All or None). commit_mo commits the changes made using the above APIs.

All these methods are invoked on a UcsHandle instance. We refer it by handle in all the examples here-after. Refer to the *Connecting Disconnecting* to create a new handle.

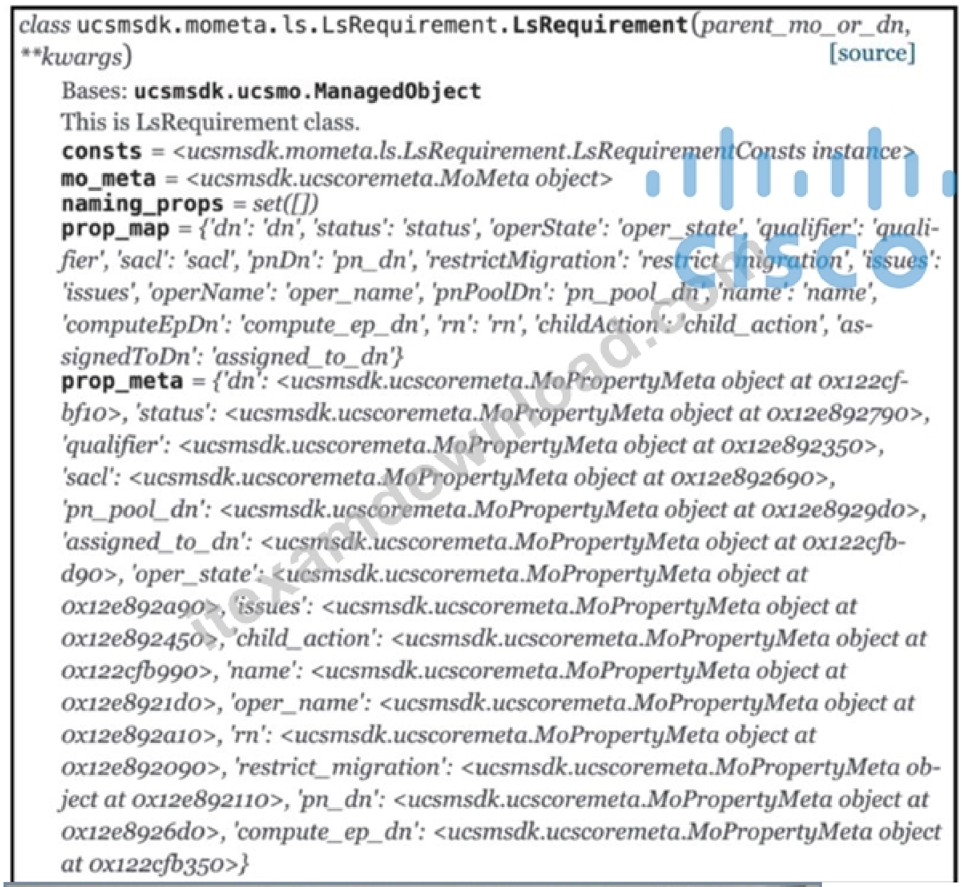
1.5.3 Creating Objects

Creating managed objects is done via add_mo API.
Example:
The below example creates a new Service Profile(LsServer) Object under the parent org-root

```
from ucsmsdk.mometa.ls.LsServer import LsServer

sp = LsServer(parent_mo_or_dn="org-root", name="sp_demo")
handle.add_mo(sp)
```

note: the changes will only be sent to server when handle.commit() is called.
Add Mo API reference



class `ucsmsdk.mometa.ls.LsRequirement.`**`LsRequirement`**(*parent_mo_or_dn*, ***kwargs*) [source]

This is LsRequirement class.

`consts` = *<ucsmsdk.mometa.ls.LsRequirement.LsRequirementConsts instance>*

`mo_meta` = *<ucsmsdk.ucscoremeta.MoMeta object>*

`naming_props` = *set([])*

`prop_map` = *{'dn': 'dn', 'status': 'status', 'operState': 'oper_state', 'qualifier': 'qualifier', 'sacl': 'sacl', 'pnDn': 'pn_dn', 'restrictMigration': 'restrict_migration', 'issues': 'issues', 'operName': 'oper_name', 'pnPoolDn': 'pn_pool_dn', 'name': 'name', 'computeEpDn': 'compute_ep_dn', 'rn': 'rn', 'childAction': 'child_action', 'assignedToDn': 'assigned_to_dn'}*
