dbt Labs dbt Analytics Engineering Certification Exam Sample Questions (Q145-Q150):

NEW QUESTION # 145

You've included the popular 'dbt-utils' package in your project. Where should you primarily expect to find the models and macros it offers?

- A. Within your 'models' directory namespaced to distinguish them from your own models.
- B. Automatically materialized as new tables in your data warehouse.
- C. Within the 'seeds' directory of your dbt project.
- D. In the 'dbt_project.yml' file under a 'packages' section.

Answer: A

Explanation:

Packages extend your project's functionality by placing items within your model's directory offering seamless integration.

NEW QUESTION # 146

Security best practices dictate that data warehouse access should follow a "least privilege" principle. How would you implement this within dbt environments?

- A. Restrict access to sensitive data in development and staging environments using encryption or masking techniques.
- B. Create separate data warehouse user accounts for development, staging, and production, each with minimal required permissions.
- C. A combination of the above approaches.
- D. Leverage dbt's built-in grants mechanism to fine-tune object-level access within models.

Answer: C

Explanation:

A: Separate accounts limit the impact of any security breach- B: dbt grants provide model-aware access control. C: Data protection should be present even in non-production environments.

NEW QUESTION # 147

You are building an incremental model.

Identify the circumstances in which `is_incremental()` would evaluate to True or False.

Answer:

Explanation:

□ Explanation:

1. There is a config block at the top of the model with `materialized = 'table'`

Answer: False

2. The corresponding table already exists in the data warehouse

Answer: True

3. The incremental model was executed with the `--full-refresh` flag

Answer: False

4. The corresponding table does not already exist in the data warehouse

Answer: False

The `is_incremental()` macro in dbt is used within an incremental model to determine whether the current invocation should perform an incremental update or a full rebuild. It evaluates to True only during an incremental run when the target table already exists in the data warehouse and dbt is not performing a full refresh.

For `is_incremental()` to return True, two conditions must be met:

* The model must be materialized as incremental, not table or view. Therefore, if the config specifies `materialized = 'table'`, the model

is not incremental, and the function evaluates to False.

* The table already exists in the target schema. In this case, dbt will run the model in incremental mode, making `is_incremental()` return `**True`.

If the incremental model is run with `--full-refresh`, dbt intentionally rebuilds the entire table, meaning `is_incremental()` evaluates to False, even if the table exists.

Lastly, if the target table does not exist yet, dbt must create it from scratch, so the run is treated as a full rebuild, not an incremental update, causing `is_incremental()` to evaluate to False.

Thus, the only scenario where `is_incremental()` returns True is when the table exists and the model is actually incremental.

NEW QUESTION # 148

(Multiple Select)

- A. Encapsulating complex logic in well-named macros with descriptive comments.
- B. Using clear and consistent naming conventions across models and macros.
- C. Preferring long, monolithic SQL files with minimal CTEs.
- D. Minimizing explicit model dependencies to create loosely coupled components.

Answer: A,B

Explanation:

Well-documented macros and consistent naming boost readability. Large monolithic SQL files hinder maintainability.

NEW QUESTION # 149

You're setting up a dbt project with a model that generates a large intermediate result. You're concerned about performance. Which approaches could be helpful?

- A. Use a staging schema for the intermediate model and adjust the job's materialization settings.
- B. Schedule the model to run only during off-peak hours.
- C. Deploy the dbt project to a smaller development environment to reduce processing overhead
- D. Investigate database-specific features (e.g., temporary tables) and refactor dbt logic to leverage them

Answer: A,D

Explanation:

A allows customizing how the dataset is handled. B can potentially lead to performance gains. C may help, but isn't a direct solution. D is unrelated to the core issue.
