Marvelous Amazon SOA-C03: New AWS Certified CloudOps Engineer - Associate Exam Guide - 100% Pass-Rate ActualCollection SOA-C03 New

Learning Materials

Amazon's SOA-C03 exam certification is one of the most valuable contemporary of many exam certification. In recent decades, computer science education has been a concern of the vast majority of people around the world. It is a necessary part of the IT field of information technology. So IT professionals to enhance their knowledge through Amazon SOA-C03 exam certification. But pass this test will not be easy. So ActualCollection Amazon SOA-C03 Exam Certification issues is what they indispensable. Select the appropriate shortcut just to guarantee success. The ActualCollection exists precisely to your success. Select ActualCollection is equivalent to choose success. The questions and answers provided by ActualCollection is obtained through the study and practice of ActualCollection IT elite. The material has the experience of more than 10 years of IT certification.

Amazon AWS Certified CloudOps Engineer - Associate Sample Questions (Q126-Q131):

NEW QUESTION # 126

A company has attached the following policy to an IAM user:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "rds:Describe*",
      "Resource": "*"
    },
    {
      "Effect": "Allow",
      "Action": "ec2:*",
      "Resource": "*",
      "Condition": {
        "StringEquals": {
          "ec2:Region": "us-east-1"
        }
      }
    },
    {
      "Effect": "Deny",
      "NotAction": [
        "ec2:*",
        "s3:GetObject"
      ],
      "Resource": "*"
    }
  ]
}
```

Which of the following actions are allowed for the IAM user?

- A. Amazon S3 PutObject operation in a bucket named testbucket.
- **B. Amazon EC2 DescribeInstances action in the us-east-1 Region.**
- C. Amazon RDS DescribeDBInstances action in the us-east-1 Region.
- D. Amazon EC2 AttachNetworkInterface action in the eu-west-1 Region.

Answer: B

Explanation:

The explicit Deny statement uses NotAction, which means it denies all actions except ec2:* and s3:GetObject.

Explicit deny overrides any allow. Therefore, even though rds:Describe* is allowed in the first statement, it is denied by the Deny statement because RDS actions are not excluded from the deny. s3:PutObject is also denied because only s3:GetObject is excluded. EC2 actions are excluded from the deny, but they still need an applicable Allow. The second statement allows ec2:* only when the EC2 Region condition equals us-east-1.

Therefore, ec2:DescribeInstances in us-east-1 is allowed, while ec2:AttachNetworkInterface in eu-west-1 is not allowed. Option C is the only permitted action.

NEW QUESTION # 127

A company has a VPC that contains a public subnet and a private subnet. The company deploys an Amazon EC2 instance that uses an Amazon Linux Amazon Machine Image (AMI) and has the AWS Systems Manager Agent (SSM Agent) installed in the private subnet. The EC2 instance is in a security group that allows only outbound traffic.

A CloudOps engineer needs to give a group of privileged administrators the ability to connect to the instance through SSH without exposing the instance to the internet.

Which solution will meet this requirement?

- A. Create a Systems Manager endpoint in the public subnet. Create an IAM role that has the AmazonSSMManagedInstanceCore permission for the EC2 instance. Create an IAM group for privileged administrators. Assign the AmazonEC2ReadOnlyAccess IAM policy to the IAM group.
- B. Create a Systems Manager endpoint in the private subnet. Update the security group to allow SSH traffic from the private network where the Systems Manager endpoint is connected. Create an IAM group for privileged administrators. Assign the PowerUserAccess managed policy to the IAM group.
- **C. Create an EC2 Instance Connect endpoint in the private subnet. Update the security group to allow inbound SSH traffic. Create an IAM group for privileged administrators. Assign the PowerUserAccess managed policy to the IAM group.**
- D. Create an EC2 Instance Connect endpoint in the public subnet. Update the security group to allow SSH traffic from the private network. Create an IAM group for privileged administrators. Assign the PowerUserAccess managed policy to the IAM group.

Answer: C

Explanation:

EC2 Instance Connect Endpoint (EIC Endpoint) enables SSH to instances in private subnets without public IPs and without needing to traverse the public internet. CloudOps guidance explains that you deploy the endpoint in the same VPC/subnet as the targets, then allow inbound SSH on the instance security group from the endpoint's security group. Access is governed by IAM--administrators must have Instance Connect permissions; while the example uses a broad policy, the key mechanism is EIC in the private subnet plus SG rules scoped to the endpoint.

Systems Manager Session Manager can provide shell access without SSH, but the requirement explicitly states "connect through SSH," making EIC the purpose-built solution. Options B and D misuse Systems Manager for SSH and propose unnecessary SG changes or incorrect endpoint placement; Option C places the endpoint in a public subnet, which is not required for private SSH access. Therefore, creating an EC2 Instance Connect endpoint in the private subnet and updating SGs accordingly meets the requirement while keeping the instance non-internet- exposed.

NEW QUESTION # 128

A company runs custom statistical analysis software on a cluster of Amazon EC2 instances. The software is highly sensitive to network latency between nodes, although network throughput is not a limitation.

Which solution will minimize network latency?

- A. Configure jumbo frames on all the EC2 instances in the cluster.
- **B. Place all the EC2 instances into a cluster placement group.**
- C. Place all the EC2 instances into a spread placement group in the same AWS Region.
- D. Configure and assign two Elastic IP addresses for each EC2 instance.

Answer: B

Explanation:

The AWS Cloud Operations and Compute documentation explains that placement groups control how EC2 instances are physically arranged within AWS data centers to optimize network performance.

Cluster placement groups place instances physically close together within a single Availability Zone, connected through high-bandwidth, low-latency networking (ideal for tightly coupled, HPC, or distributed workloads).

Spread placement groups distribute instances across distinct racks or Availability Zones for fault tolerance, increasing latency.

Partition placement groups separate instances into partitions for isolation, not latency reduction.

Therefore, to minimize latency for workloads such as computational clusters, the CloudOps engineer should use a cluster placement group. This placement ensures single-digit microsecond latency and enhanced packet rate performance between instances.

Elastic IPs (Option B) do not influence internal networking. Jumbo frames (Option C) can marginally improve throughput but do not reduce propagation latency. Spread placement (Option D) increases distance, worsening latency.

Hence, Option A -- using a cluster placement group -- delivers the lowest possible network latency and is AWS's best-practice design for HPC-style clusters.

NEW QUESTION # 129

A medical research company uses an Amazon Bedrock powered AI assistant with agents and knowledge bases to provide physicians quick access to medical study protocols. The company needs to generate audit reports that contain user identities, usage data for Bedrock agents, access data for knowledge bases, and interaction parameters.

Which solution will meet these requirements?

- A. Use Amazon CloudWatch to capture generative AI application logs. Stream the logs to Amazon OpenSearch Service. Use an OpenSearch dashboard visualization to generate reports.
- B. Use AWS CloudTrail to capture generative AI application logs. Stream the logs to Amazon Managed Service for Apache Flink. Use SQL queries to generate reports.
- C. Use Amazon CloudWatch to log API events from generative AI workloads. Send the events to an Amazon S3 bucket. Use Amazon Athena queries to generate reports.
- **D. Use AWS CloudTrail to log API events from generative AI workloads. Store the events in CloudTrail Lake. Use SQL-like queries to generate reports.**

Answer: D

Explanation:

As per AWS Cloud Operations, Bedrock, and Governance documentation, AWS CloudTrail is the authoritative service for capturing API activity and audit trails across AWS accounts. For Amazon Bedrock, CloudTrail records all user-initiated API calls, including interactions with agents, knowledge bases, and generative AI model parameters.

Using CloudTrail Lake, organizations can store, query, and analyze CloudTrail events directly without needing to export data.

CloudTrail Lake supports SQL-like queries for generating audit and compliance reports, enabling the company to retrieve information such as user identity, API usage, timestamp, model or agent ID, and invocation parameters.

In contrast, CloudWatch focuses on operational metrics and log streaming, not API-level identity data. OpenSearch or Flink would add unnecessary complexity and cost for this use case.

Thus, the AWS-recommended CloudOps best practice is to leverage CloudTrail with CloudTrail Lake to maintain auditable, queryable API activity for Bedrock workloads, fulfilling governance and compliance requirements.

NEW QUESTION # 130

A company hosts a web application on an Amazon EC2 instance. The web server logs are published to Amazon CloudWatch Logs. The log events have the same structure and include the HTTP response codes associated with user requests. The company needs to monitor the number of times the web server returns an HTTP 404 response.

What is the MOST operationally efficient solution that meets these requirements?

- A. Create an AWS Lambda function that runs a CloudWatch Logs Insights query every hour.
- B. Create a CloudWatch Logs subscription filter that counts the number of HTTP 404 responses.
- **C. Create a CloudWatch Logs metric filter that counts the number of times the web server returns an HTTP 404 response.**
- D. Create a script that runs a CloudWatch Logs Insights query every hour.

Answer: C

Explanation:

CloudWatch Logs metric filters allow log data to be converted into CloudWatch metrics in near real time.

This enables continuous monitoring without custom code or scheduled queries. Metric filters are ideal when log events have a consistent structure and specific patterns, such as HTTP response codes.

By defining a metric filter that matches HTTP 404 responses, CloudWatch can increment a metric each time a

404 occurs. This metric can then be used for dashboards, alarms, and trend analysis. This approach is fully managed, scalable, and requires minimal operational effort.

Options B, C, and D rely on subscription filters or periodic queries, which introduce unnecessary complexity, latency, and maintenance overhead. Therefore, metric filters are the most efficient solution.
