- C. Amazon CloudFront to edge locations
- D. AWS CloudTrail across multiple Availability Zones

Answer: C

You can deliver content and decrease end-user latency of your web application using Amazon CloudFront.

CloudFront speeds up content delivery by leveraging its global network of data centers, known as edge locations, to reduce delivery

time by caching your content close to your end users. CloudFront fetches your content from an origin, such as an Amazon S3 bucket, an Amazon EC2 instance, an Amazon Elastic Load Balancing load balancer or your own web server, when it's not already in an edge location. CloudFront can be used to deliver your entire website or application, including dynamic, static, streaming, and interactive content.
