## GUIDEWIRE ASSOCIATE EXAM 2024 (QUESTIONS WITH CORRECT ANSWERS ) GUARANTEED PASS

What are some reasons for a non-developer to understand the technology stack?

- To determine what data is stored and if new requirements need additional data elements.
- To know how and where data is used.
- To communicate what data may be needed beyond what is in the base configuration.
- To determine valid values or circumstances for the new data.

What are some examples of what can be configured in the User Interface?

- The order of fields, change labels, regroup fields (simple change).
- Fields on a screen (moderate change).
- Screens (complex change).
- Screen-based logic (complex change).

What are the four main areas of configuration in a Guidewire application?

1. User Interface
2. Data Model
3. Application Logic
4. Integration

What are some of the technologies used in InsuranceSuite applications?

## Pass Guaranteed 2026 Accurate Guidewire InsuranceSuite-Analyst: New Associate Certification - InsuranceSuite Analyst - Mammoth Proctored Exam Exam Guide

As we all know, time and tide waits for no man. If you really want to pass the InsuranceSuite-Analyst exam, you should choose our first-class InsuranceSuite-Analyst study materials. And you cannot miss the opportunities this time for as the most important and indispensable practice materials in this line, we have confidence in the quality of our InsuranceSuite-Analyst practice materials, and offer all after-sales services for your consideration and acceptance.

## Guidewire Associate Certification - InsuranceSuite Analyst - Mammoth Proctored Exam Sample Questions (Q30-Q35):

### NEW QUESTION # 30

\_\_\_\_\_ provide starting points for solutions that can be customized and added to the Guidewire products.

- A. Accelerators
- B. Product Documentation
- C. User Story Cards
- D. Extension Packs

**Answer: A**

Explanation:

Comprehensive and Detailed Explanation:

Accelerators (Option D) are the correct Guidewire term for pre-built solutions provided by Guidewire or its partners (available on the Guidewire Marketplace).

\* Definition: An Accelerator is a software asset that provides a "starting point" for a specific business problem or integration (e.g., a "London Market Accelerator" or a specific "Payment Gateway Accelerator").

\* Purpose: They are designed to be customized. Unlike the core product (which you configure) or a SaaS service (which you consume), an accelerator is often code or configuration that you download, install, and then modify to fit your specific project needs. They are not "plug-and-play" in the strictest sense; they accelerate the development by providing the foundational code.

Why other options are incorrect:

\* B. Extension Packs: While similar, "Extension Packs" (now often referred to as simply Extensions or Standards-based templates) typically refer to smaller, verified add-ons that might not require as much

"customization" as an accelerator. However, "starting point for solutions" is the textbook definition for Accelerators.

\* A. User Story Cards: These are documentation artifacts, not software solutions.

### NEW QUESTION # 31

When prioritizing the implementation of a new state regulation for flood risk assessment in commercial property policies, which factors are most crucial for ensuring strategic value alignment and a successful Guidewire Cloud deployment?

- A. Ensuring the new solution adheres to Guidewire Cloud Standards to enable seamless future updates and optimal platform performance
- B. Implementing only the minimum data capture quickly and postponing proper data modeling
- C. Focusing solely on the legal interpretation of the regulation, even if it requires complex custom development
- D. Analyzing how the new assessment process aligns with the company's long-term objective of reducing overall loss exposure and improving underwriting excellence
- E. Maximizing reuse of legacy system code and UI elements regardless of Guidewire Cloud Standards
- F. Prioritizing integration with a third-party flood modeling service that significantly deviates from Guidewire OOTB capabilities

**Answer: A,D**

Explanation:

In Guidewire Cloud implementations, prioritization decisions must balance regulatory compliance, business value, and long-term platform sustainability. The most crucial factors are strategic business alignment and adherence to Guidewire Cloud Standards, making Options A and C correct.

Analyzing how the regulation aligns with long-term underwriting and risk management objectives (Option A) ensures the solution delivers more than compliance. This approach supports value-driven requirements by improving underwriting quality and reducing loss exposure, rather than treating regulation as a standalone obligation.

Ensuring adherence to Guidewire Cloud Standards (Option C) is equally critical. These standards protect upgradeability, performance, and operational stability. Solutions that follow Cloud Standards are easier to maintain and less likely to cause issues during future platform upgrades.

The remaining options represent short-term or high-risk approaches. Over-customization (Option B), deviation from OOTB functionality (Option D), deferring proper data modeling (Option E), and reusing legacy patterns (Option F) all increase technical debt and threaten cloud success.

### NEW QUESTION # 32

A typelist is:

- A. Associated with a typekey field
- B. A set of values used as the source of drop-down lists
- C. A set of references to another entity
- D. A set of fields or attributes related to an object

**Answer: A,B**

Explanation:

In Guidewire InsuranceSuite, a typelist is a fundamental data modeling construct used to represent a controlled set of allowable values for a given business concept. The correct answers are Option B and Option D.

A typelist provides a predefined set of values that are commonly used as the source for drop-down lists in the user interface (Option B). Examples include policy statuses, coverage types, loss causes, or certification statuses. Using typelists ensures data consistency, reduces free-text entry errors, and supports standardization across the application.

Typelists are associated with typekey fields (Option D). A typekey is the data type used in the Guidewire data model to reference a typelist. When an entity field is defined as a typekey, it can only store values from the associated typelist. This tight coupling between typelists and typekey fields enables consistent behavior across UI, rules, validations, and integrations.

The other options are incorrect. Option A describes entity relationships, not typelists. Option C refers to a group of fields or attributes, which is unrelated to the concept of a typelist.

For analysts, understanding typelists is critical when documenting requirements that involve selectable values.

Analysts often define new typelist values or request new typelists when the out-of-the-box options do not meet business needs. This knowledge helps analysts communicate effectively with developers and avoid unnecessary custom data structures while following Guidewire's configure-over-customize principle.

### NEW QUESTION # 33

What features have been added to InsuranceSuite to make it more accessible to disabled users that Business Analysts should consider when making changes to the User Interface? (Choose two)

- A. User interface support with closed captions for the hearing impaired
- B. New screen settings for user interface magnification and color contrast
- C. Screen reader support with Alt text and WAI-ARIA attributes
- D. Braille keyboard support for the visually impaired

**Answer: B,C**

Explanation:

Guidewire InsuranceSuite includes several accessibility enhancements designed to support users with disabilities and align with modern accessibility standards. Business Analysts must be aware of these features when defining or modifying UI requirements to ensure accessibility is preserved.

One key enhancement is user interface magnification and color contrast settings (Option B). These features support users with visual impairments by allowing them to adjust screen readability without altering business functionality.

Another critical capability is screen reader support using Alt text and WAI-ARIA attributes (Option C).

These standards enable assistive technologies to interpret UI elements correctly, ensuring users who rely on screen readers can navigate and interact with the application effectively.

The other options are incorrect. Braille keyboard support (Option A) and closed-caption UI support (Option D) are not standard InsuranceSuite features.

Considering accessibility early helps analysts design inclusive solutions, avoid rework, and comply with accessibility regulations and best practices.

### NEW QUESTION # 34

Data Model Entities: Match the entity type with the appropriate description.

□

**Answer:**

Explanation:

Type key#A single reference to a value in a typelist

Foreign key#A single reference to the ID of another entity

Field#Atomic data stored about the entity (non-restricted values)

Array key#A set of references to another entity

In the Guidewire Data Model, entities consist of different types of columns/properties that define their structure and relationships:

\* Type key (B):This field creates a relationship between the entity and a Typelist(a pre-defined list of valid values, like a dropdown menu). For example, a Status field that can only be "Open", "Closed", or

"Pending" is a Type key pointing to the StatusType typelist. It references a single specific value from that list.

\* Foreign key (D):This creates a link to aspecific instance of another entity. It stores the unique ID of that related object. This represents a "Many-to-One" or "One-to-One" relationship. For example, a Claim entity has a Foreign Key to a Policy entity (because one claim belongs to one specific policy).

\* Field (A):Often called a "Column" or "Atomic Field," this stores raw data such as Strings, Integers, Booleans, or Dates. It holdsatomic data(e.g., "First Name", "Loss Date", "Coverage Amount") that is not restricted to a specific list of values like a Type key is.

\* Array key (C):This represents a "One-to-Many" relationship. It allows the parent entity to link to a collection (set)of child entities. For example, a Policy entity has anArrayOf Vehicle entities (because one policy can cover multiple vehicles).

## NEW QUESTION # 35
