Choosing CPIM-8.0 Latest Material Makes It As Easy As Eating to Pass Certified in Planning and Inventory Management (CPIM 8.0)

If you are preparing the exam, you will save a lot of troubles with the guidance of our CPIM-8.0 training engine. Our company is aimed at relieving your pressure from heavy study load. So we strongly advise you to have a try on our CPIM-8.0 Study Guide. If you want to know them before your purchase, you can free download the demos of our CPIM-8.0 exam braindumps on the website, which are the small part of the learning questions.

APICS Certified in Planning and Inventory Management (CPIM 8.0) Sample

Questions (Q440-Q445):

NEW QUESTION # 440

A security specialist is responsible to improve the security awareness program of a medium-sized organization and is tasked to track blocked targeted attacks. Which of the following BEST describes the outcome of the security specialist's use of metrics for this task?

- A. An increase in reported changes in click percentages that aligns with a decrease in the number of phishing and incidents reported.
- **B. An increase in reported suspicious activity that aligns with a decrease in detection of malware and DNS queries to blocked sites.**
- C. A decrease in reported suspicious activity that aligns with an increase in detection of malware and DNS queries to blocked sites.
- D. A decrease in reported changes in click percentages that aligns with an increase in the number of phishing and incidents reported.

Answer: B

NEW QUESTION # 441

An infrastructure team is setting up a wireless network for employees at a new location of the organization that is located near a very busy city transport hub. Which should be the MOST important antenna consideration with regard to securing the wireless network for the infrastructure team?

- A. Parabolic antenna is used for signal convergence.
- B. Network efficiently allows maximum channel separation.
- **C. Network's Service Set Identifier (SSID) visibility and vulnerabilities are not cast out too far.**
- D. Implement Wired Equivalent Privacy (WEP) encryption.

Answer: C

NEW QUESTION # 442

Which of the following statements is true about the meantime between failures (MTBF) measure?

- A. It is the same as operating life or service life.
- B. An increase in MTBF is proportional to an increase in quality.
- **C. It is a useful measure of reliability.**
- D. It is used for non-repairable products.

Answer: C

Explanation:

Mean time between failures (MTBF) is the average time that elapses from one unplanned breakdown to the next, under normal operating conditions. It is a useful measure of reliability because it indicates how long a repairable system typically operates before failing. Reliability is the absence of unplanned downtime, and MTBF measures how often a system stops performing as expected. The other statements are not true about MTBF. MTBF is not used for non-repairable products, as they cannot be fixed and put back into operation after a failure. For non-repairable products, mean time to failure (MTTF) is used as a measure of reliability. MTBF is not proportional to quality, as quality is a broader concept that encompasses not only reliability, but also performance, durability, and customer satisfaction. MTBF is not the same as operating life or service life, as they refer to the total time that a system can function before reaching the end of its useful life, while MTBF refers to the average time between failures within the operating life. NEW QUESTION # 443

Under which of the following conditions is excess capacity most likely a good substitute for safety stock?

- A. Lead time for the product is longer than customers are willing to wait.
- B. The cost to maintain one unit in inventory for a year is less than the direct labor cost.
- **C. The cost of excess capacity is less than the cost of an additional unit of safety stock in the same period.**

- D. The service level with safety stock is more than the service level with excess capacity.

Answer: C

Explanation:

Excess capacity is the amount of capacity that is available beyond the normal or expected demand. Safety stock is the inventory that is held to protect against uncertainties in demand, supply, or lead time. Excess capacity can be a good substitute for safety stock when the cost of excess capacity is less than the cost of an additional unit of safety stock in the same period. This means that the opportunity cost of having idle resources is lower than the carrying cost of holding extra inventory. In this case, excess capacity can be used to produce more units in response to demand fluctuations, rather than relying on safety stock to meet customer orders.
