Linux Foundation Certified GitOps Associate Sample Questions (Q17-Q22):

NEW QUESTION # 17

In the context of GitOps, what is the purpose of a State Store?

- A. To provide a system for storing immutable versions of Desired State declarations.
- B. To provide a system for storing temporary state data during GitOps deployments.
- C. To provide a system for storing the current state of an application.
- D. To provide a system for storing mutable versions of Desired State declarations.

Answer: A

Explanation:

A State Store in GitOps is the system of record where Desired State declarations are kept. It must be immutable and versioned to ensure full auditability, traceability, and rollback capabilities. Git itself is the most common State Store.

"The Desired State must be stored in a State Store that is versioned and immutable. This guarantees traceability and enables recovery by reverting to previous commits." Thus, the correct answer is D.

NEW QUESTION # 18

When using Kustomize, how are resources, configurations, and customizations commonly organized?

- A. In separate configuration files for each resource.
- B. By specifying all resources inline in the customization file.
- C. Using a combination of folder directories and referenced folder/file paths.
- D. In a single configuration file.

Answer: C

Explanation:

Kustomize is a GitOps tool for managing Kubernetes configurations declaratively. It uses a folder structure with configuration files and a kustomization.yaml file that references resources and overlays. This enables customization without modifying the base manifests.

"Kustomize allows customization of Kubernetes manifests by organizing resources in directories and referencing them through file paths in a kustomization file. This directory-based approach supports overlays, reusability, and modular configuration." Thus, the correct answer is D.

NEW QUESTION # 19

In the context of GitOps, what does Desired State refer to?

- A. The state that the system or application should be in.
- B. The state that the system or application was in before any changes were made.
- C. The current state of the system or application.
- D. The state that the system or application will be in after all changes are made.

Answer: A

Explanation:

The Desired State is the declarative specification stored in Git that defines how the system should look and behave. It is the reference point against which the actual state is continuously reconciled.

"Desired state is the complete declarative specification of a system stored in Git. It defines how the system should be configured and serves as the source of truth for reconciliation." Thus, the correct answer is A.

NEW QUESTION # 20

You are implementing GitOps in your organization and have configured the Desired State of your applications in a Git repository. However, during the deployment process, you encounter an error in the configuration. What is the recommended action in this scenario?

- A. Roll back the deployment to the previous working version while investigating the error in the configuration file.
- B. Continue to monitor the issue and proceed with the deployment, as it may not significantly impact the application.
- C. Raise a ticket with the development team to fix the error in the configuration file.
- D. Make a call to the Kubernetes API with the correction.

Answer: A

Explanation:

GitOps emphasizes immutability and auditability. If an error occurs in the configuration stored in Git, the system should be rolled back to the last known good state while the error is fixed. This preserves system reliability and aligns with the GitOps principle of rollback through version control.

"With Git as the source of truth, if an error is introduced, the system can be rolled back by reverting to a previous commit. This ensures stability while the faulty configuration is corrected." Thus, the recommended action is C: Roll back to the previous working version.

NEW QUESTION # 21

You are working on a GitOps project and want to trigger a reconcile process before the next scheduled reconciliation. What is the recommended way to do this?

- A. Manually execute a script to initiate the reconcile process on the cluster using GitOps tool CLI commands.
- B. Use a webhook to trigger the reconcile process based on events or changes in the Git repository.
- C. Adjust the reconcile process interval time.
- D. Schedule a cron job to run the reconcile process periodically, using RBAC to authenticate.

Answer: B

Explanation:

Although reconciliation is continuous in GitOps, tools often allow reconciliation to be triggered earlier than the normal polling interval. The recommended approach is to use webhooks from the Git repository, which notify the GitOps controller of changes and trigger an immediate reconcile.

"While reconciliation loops continuously compare desired and actual state, reconciliation can be triggered sooner by webhooks from version control events, ensuring timely application of changes." Thus, the correct answer is A.
