Study Your Salesforce AP-202: B2B Commerce for Developers Accredited Professional Exam with Well-Prepared Latest AP-202 Exam Questions Effectively

Dear everyone, to get yourself certified by our AP-202 exam prep. We offer you the real and updated DumpsKing AP-202 study material for your exam preparation. The AP-202 online test engine can create an interactive simulation environment for you. When you try the AP-202 online test engine, you will really feel in the actual test. Besides, you can get your exam scores after each test. What's more, it is very convenient to do marks and notes. Thus, you can know your strengths and weakness after review your AP-202 test. Then you can do a detail study plan and the success will be a little case.

Salesforce B2B Commerce for Developers Accredited Professional Sample Questions (Q86-Q91):

NEW QUESTION # 86

A developer has created a custom Lightning web component for the Cart page that needs to react to changes to cart items from the standard cart component.

How should the developer implement the custom component so changes to cart items and quantities are reflected?

- A. Add a listener for the cartItemUpdate Lightning event.
- B. Add an event listener for the cartchanged DOM (Document Object Model) event.
- C. **Subscribe to events on the lightning_commerce_cartChanged channel using the Lightning**
- D. Listen for events on the lightning_commerce_cartChanged channel with the Lightning Event

Answer: C

Explanation:

The developer should implement the custom component so that it subscribes to events on the lightning_commerce_cartChanged

channel using the Lightning Message Service. This is the recommended way to communicate between custom and standard components on the Cart page, as it allows the custom component to receive updates from the standard cart component whenever the cart items or quantities change. The Lightning Message Service is a pub/sub mechanism that enables components to communicate across the DOM, regardless of their namespace, technology, or source. The lightning_commerce_cartChanged channel is a predefined channel that carries information about the cart state, such as the cart ID, the cart items, and the cart total. NEW QUESTION # 87

What are three ways to test the value of Page Label on any Salesforce B2B Commerce Community Page? (3 answers)

- A. Execute `CCRZ.processPageLabelMap('PAGE_LABEL_NAME')` in the JavaScript console.
- B. Execute `(('PAGE_LABEL_NAME'))` in the JavaScript console
- C. Enable the 'display page label names' in cc admin.
- D. Access the source HTML for the page via the browser developer tools.
- E. Execute `CCRZ.pagevars.pageLabels['PAGE_LABEL_NAME']` in the JavaScript console.

Answer: A,C,E

Explanation:

Three ways to test the value of Page Label on any Salesforce B2B Commerce Community Page are:

Execute `CCRZ.pagevars.pageLabels['PAGE_LABEL_NAME']` in the JavaScript console. This will return the value of the page label with the given name from the pagevars object, which contains all the page labels that are used on the page.

Execute `CCRZ.processPageLabelMap('PAGE_LABEL_NAME')` in the JavaScript console. This will return the value of the page label with the given name from the pageLabelMap object, which contains all the page labels that are defined in CCAdmin.

Enable the 'display page label names' in cc admin. This will display the name of each page label next to its value on the storefront pages, which can help identify and verify the page labels. Salesforce B2B Commerce and D2C Commerce Developer Guide, Page Labels

NEW QUESTION # 88

What target does a developer need to set in the js-meta.xml file when creating a custom LWC component for use in the Checkout Flow?

- A. lightning_FlowScreen
- B. lwc__FlowComponent
- C. lightning__CheckoutFlow
- D. lwc__flow

Answer: B

Explanation:

When creating a custom Lightning Web Component (LWC) for use in the Checkout Flow, a developer must set the target in the js-meta.xml file to `lwc__FlowComponent`. This target specifies that the LWC is intended for use within the flow component framework, allowing it to be utilized specifically in the context of Salesforce Flows, including those used in the checkout process. Salesforce documentation on developing custom LWCs for various targets would detail this requirement, ensuring that developers understand how to correctly package and deploy their components for the intended use case.

NEW QUESTION # 89

What are three ways to implement custom post Order processing? (3 answers)

- A. Modify or add custom Cart formula fields to handle logic.
- B. Use Process builder to implement business processes that execute when an Order record is created.
- C. Use `cc_hk_Order.placeTarget` to define a new Order Confirmation page which executes additional business logic.
- D. Extend `cc_hk_invoice` to handle custom business logic post Order processing
- E. Use a Salesforce workflow rule that executes when an Order record is created.

Answer: B,C,D

Explanation:

Three ways to implement custom post Order processing are:

Extend `cc_hk_invoice` to handle custom business logic post Order processing. This hook allows modifying the invoice data or performing additional actions after an Order is placed. For example, the hook can send an email notification or update a custom field on the invoice record.

Use `cc_hk_Order.placeTarget` to define a new Order Confirmation page which executes additional business logic. This hook allows specifying a custom Visualforce page that will be displayed after an Order is placed. The custom page can include additional business logic or user interface elements.

Use Process Builder to implement business processes that execute when an Order record is created. Process Builder is a tool that allows creating workflows and actions based on criteria and conditions. For example, Process Builder can create a task, send an email, or update a record when an Order record is created. Salesforce B2B Commerce and D2C Commerce Developer Guide, Hooks, Process Builder

NEW QUESTION # 90

What are two common and maintainable ways the content layout of a Lightning Web Component can be implemented?

- A. Applying SLDS classes to internal elements
- B. Spreading layout styles across several separate components
- C. Using inline styles
- D. Styling the `:host` pseudo-element (or other elements) via the CSS file

Answer: A,D

Explanation:

For maintainable and scalable Lightning Web Component development, it's recommended to style components by targeting the `:host` pseudo-element in the component's CSS file and by applying Salesforce Lightning Design System (SLDS) classes to internal elements. These practices ensure consistent styling that aligns with Salesforce's design standards and provides a clear separation of concerns between component structure and styling.

NEW QUESTION # 91

.....

The AP-202 certification exam is one of the top-rated career advancement certifications in the market.
