Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q469-Q474):

NEW QUESTION # 469
Your company is getting ready to do a major public announcement of a social media site on AWS. The website is running on EC2 instances deployed across multiple Availability Zones with a Multi-AZ RDS MySQL Extra Large DB Instance. The site performs a high number of small reads and writes per second and relies on an eventual consistency model. After comprehensive tests you discover that there is read contention on RDS MySQL. Which are the best approaches to meet these requirements? (Choose 2 answers)

- A. Add an RDS MySQL read replica in each availability zone
- B. Increase the RDS MySQL Instance size and Implement provisioned IOPS
- C. Implement sharding to distribute load to multiple RDS MySQL instances
- D. Deploy ElasticCache in-memory cache running in each availability zone

Answer: B,D

NEW QUESTION # 470

A company is planning to migrate 40 servers hosted on premises in VMware to the AWS Cloud. The migration process must be implemented with minimal downtime. The company also wants to test the servers before the cutover date.
Which solution meets these requirements?

- A. Deploy the AWS DataSync agent into the on-premises environment. Use DataSync to migrate the servers.
- B. Deploy an AWS Snowball device connected by way of RJ45 to the on-premises network. Use Snowball to migrate the servers.
- C. Deploy the AWS Server Migration Service (AWS SMS) connector into the on-premises environment. Use AWS SMS to migrate the servers.
- D. Deploy an AWS Database Migration service (AWS DMS) replication instance into AWS. Use AWS DMS to migrate the servers.

Answer: A

NEW QUESTION # 471

A company needs to extract the names of ingredients from recipe records that are stored as text files in an Amazon S3 bucket A web application will use the ingredient names to query an Amazon DynamoDB table and determine a nutrition score.
The application can handle non-food records and errors The company does not have any employees who have machine learning knowledge to develop this solution Which solution will meet these requirements MOST cost-effectively?

- A. Use an Amazon EventBridge rule to invoke an AWS Lambda function when a PutObject request occurs Program the Lambda function to analyze the object and extract the ingredient names by using Amazon SageMaker Store the inference output from the SageMaker endpoint in the DynamoDB table.
- B. Use S3 Event Notifications to invoke an AWS Lambda function when PutObject requests occur Program the Lambda function to analyze the object and extract the ingredient names by using Amazon Comprehend Store the Amazon Comprehend output in the DynamoDB table.
- C. Use an Amazon EventBridge rule to invoke an AWS Lambda function when PutObject requests occur. Program the Lambda function to analyze the object by using Amazon Forecast to extract the ingredient names Store the Forecast output in the DynamoDB table.
- D. Use S3 Event Notifications to invoke an AWS Lambda function when PutObject requests occur Use Amazon Polly to create audio recordings of the recipe records. Save the audio files in the S3 bucket Use Amazon Simple Notification Service (Amazon SNS) to send a URL as a message to employees Instruct the employees to listen to the audio files and calculate the nutrition score Store the ingredient names in the DynamoDB table.

Answer: B

Explanation:
This solution meets the following requirements:
It is cost-effective, as it only uses serverless components that are charged based on usage and do not require any upfront provisioning or maintenance.
It is scalable, as it can handle any number of recipe records that are uploaded to the S3 bucket without any performance degradation or manual intervention.
It is easy to implement, as it does not require any machine learning knowledge or complex data processing logic. Amazon Comprehend is a natural language processing service that can automatically extract entities such as ingredients from text files. The Lambda function can simply invoke the Comprehend API and store the results in the DynamoDB table.
It is reliable, as it can handle non-food records and errors gracefully. Amazon Comprehend can detect the language and domain of the text files and return an appropriate response. The Lambda function can also implement error handling and logging mechanisms to ensure the data quality and integrity.
